# FOREWORD

Brief biographical sketches of scientists born in Indiana, college- or university-trained in Indiana, or employed here, comprise the bulk of this volume. In addition, there are analyses of these scientists by where they were trained, by science, and by places of birth and of work. Some of the influences which apparently or obviously contributed to their achievement are also discussed. Brief summaries of the contributions of Indiana scientists in certain sciences are also given, as are summaries of the contributions made by various institutions. Several of these were contributed by specialists, under their own name. A summary and some conclusions of the book comprise Chapter I.

For the purpose of this volume, a person is classed as a scientist if he is sketched in one or more of the eight editions of *American Men of Science*, 1906-49. Included also are some persons who died before the first edition was compiled, who became significant in Indiana science after the last edition, or whose contributions to Indiana science are such as clearly to entitle them to sketching in this book.

The bulk of the biographical data here presented came from *American Men of Science* (Science Press, Lancaster, Penn.) under special arrangements with the present editor, Jaques Cattell. Numerous sketches are based, however, at least in part, on data given in one or more of the biennial volumes of *Who's Who in America* (A. N. Marquis Co., Chicago), or in necrologies of deceased members published in the *Proceedings* of the Indiana Academy of Science. Some data came from various other sources.

Persons born and educated in other states or countries and employed in Indiana less than two years are not sketched here, nor are those who came into the state and received a master's degree only and then left.

Included among the approximately 4,500 scientists here sketched are a considerable number of engineers, agriculturists, physicians, and others who some readers will believe should not have been included among Indiana scientists. However, science is very broad and notable contributions to organized knowledge are made in many fields. Contributions sufficient to merit, in the opinions of the able editors of *American Men of Science*, sketching in that directory are here judged to entitle the person, if born in Indiana or trained or employed here, to sketching in this volume.

## ACKNOWLEDGEMENTS

This book was made possible only by the work of many individuals. First are the many scientists here sketched who supplied biographical sketches to the editors of *American Men of Science* or of *Who's Who in America*, or to other sources from which was obtained the information here presented. An appreciable number of scientists supplied the author information which has been incorporated in the sketches here given. Prof. Will E. Edington, for several years chairman of the committee of the Indiana Academy of Science on Indiana men of science, assembled from diverse sources, often at considerable effort, biographical sketches of various of the older scientists, persons not sketched in even the first editions of *Who's Who* (1898) or of *American Men of Science* (1906). The preparation of a card catalog of Indiana scientists was done with the aid of research assistants, hired with funds supplied 1945-49 by the Graduate School of Indiana University and since mid-1949 by the Indiana Academy of Science from personal donations of John S. Wright. The typing was mostly paid for from this latter source, as was the final editing, done by Bernita Gwaltney. Much of the final typing was ably done by Mrs. Yvonne Hoard.

In addition to the several men who contributed short sections on their science or institution and are so accredited, several others who requested that their name not be mentioned have aided in improving the summaries. Helpful suggestions on parts of this volume, notably the two articles reprinted, were also received from several others. Dr. Zabel, co-author of one reprinted article, compiled a considerable share of the information there used.

Special acknowledgement is due John S. Wright, whose encouragement and other aid have made this book possible. Without assurance that it would be appropriately published and widely distributed where it can be of service, I would not have had the courage to devote the time and energy required.

## CHAPTER I

### SUMMARY AND CONCLUSIONS

Indiana has contributed many leaders and is widely known for famous authors and journalists. Far less well known is the fact that Indiana has been the birthplace of a large number of scientists, a goodly number of whom have been highly distinguished. For example, two Nobel prize winners were born in Indiana, as were 19 members of the National Academy of Sciences and 81 starred scientists. (These men are listed in Chapter IV.) Many other Hoosier scientists who for one reason or another have not won these particular honors have contributed notably to science and to industry, and are widely respected.

Although it is generally realized that scientists are important—indeed, precious—little research has been done on what conditions are especially conducive to the production of scientists. As a geographer, I have long been interested in where various commodities, such as wheat, hogs, coal, furniture, and works of art, are produced. Geographers are expected to know not only where all sorts of things are produced, but also why they are produced there; that is, what conditions favor their production.

It is coming to be widely recognized that man himself is civilization's most valuable resource. Though this concept is relatively new, it is surprising that so few earnest efforts have been made to learn the conditions conducive to the production of superior men. My own study of the geography of Indiana notables commenced in 1919 when I was writing the geography section of the *Handbook of Indiana Geology* for the then newly-established State Department of Conservation. I had made maps showing where in Indiana the most corn, wheat, peaches, coal, lumber, flour, furniture, etc., were produced. Then the birthplaces of a dozen famous Indiana authors were mapped, and it was seen that most of the authors came from less than one-fifth of the state. Two years later, a list of the Hoosier scientists starred in the 1921 edition of *American Men of Science* was compiled and their birthplaces plotted. Although their birthplaces are less concentrated in one part of the state than are those of the famous

authors, most of the state had yielded few of these leading scientists.

This distribution aroused my scientific curiosity. Additional lists of Hoosier notables were gathered: college presidents, engineers, presidents of leading societies, etc. The evidence accumulating led to an expansion of the study to include other states. In 1928, *The Geography of American Notables* was published by Indiana University, and the volume aroused such widespread interest as to be soon out of print. During the next 20 years, further studies of notables were made, especially of distinguished scientists, and partly published in journals. The data on the starred scientists formed the nucleus of a volume published by the Johns Hopkins University Press in December, 1947. (*Scientists Starred 1903-1943, in "American Men of Science."*)

Subsequently, additional studies of Indiana scientists were made and partly published in the *Proceedings of the Indiana Academy of Science*. These earlier studies and many others are the basis for the present volume.

The bulk of *Indiana Scientists* consists of brief biographical sketches of certain scientists who were born in Indiana, received their college or doctoral training here, or pursued scientific work here for two years or longer. Those who contributed notably to science in Indiana have fuller sketches than those merely born, college-trained, or briefly employed in the state. Most of the persons sketched are those denoted as significant American scientists by appearing in one or more of the eight editions of *American Men of Science* from 1906 to 1944.

Another section of *Indiana Scientists*, Chapter III, consists of summaries by institutions of their contributions of scientists, and summaries by science of the chief personalities and contributions of Indiana scientists. These summaries, which are especially notable, are partly contributed by or with the aid of specialists, each listed under the title. It is hoped that from time to time more of this much-needed summary information will be contributed to the *Proceedings of the Indiana Academy of Science* and to the various journals.

Chapter IV presents lists and other data as to some of these scientists. Finally, Chapter V is a series of special studies of some of the scientists reprinted from the *Proceedings*.

The summary and conclusions make up the other chief part of the volume, Chapter I.

Of the about 4,340 scientists sketched, slightly more than a fourth are chemists; about a sixth, biologists; nearly an eighth, physicists; and nearly an eighth, engineers. In addition, there are about 250 mathematicians, 210 psychologists, 130 geologists or geographers, and almost 100 each of bacteriologists, pharmacologists, and physiologists. A score of other disciplines are represented by smaller numbers.

The number in each of the categories, alphabetically arranged, appears below. (Individuals who list two or more specialties are classed with the first named.)

Agricultural economics, 33; agronomy, 48; anatomy, 43; animal husbandry, 27; anthropology or archeology, 22; astronomy, 33; bacteriology, 95; biology, 79; microbiology, 3; biophysics, 3; botany, 168; ceramics, 3; chemistry (type unspecified), 736; agricultural chemistry, 16; analytical chemistry, 26; biochemistry, 89; inorganic chemistry, 16; organic chemistry, 271; petroleum chemistry, 3; pharmaceutical chemistry, 21; physical chemistry, 94; physiological chemistry, 10; (total chemistry, 1282 plus 182 chemical engineers); conservation, 3; cytology, 8; dairy husbandry, 26; dentistry, etc., 9; dermatology, 3; ecology, 14 (animal, 7; plant, 7); education (chiefly physical), 16; embryology, 9; entomology, 57; engineering (not specified), 79; aeronautical engineering, 12; agricultural engineering, 6; chemical engineering, 182; civil engineering, 31; electrical engineering, 73; mechanical engineering, 108; petroleum engineering, 5; radio engineering, 9; sanitary engineering, 7; (total engineering, 513); ethnology, 1; eugenics, 1; foods, 10; forestry, 19; genetics, 26; geography, 33; geology, 88; geophysics, 3; health (public), 14; histology, 15; horticulture, 37; hydrology, 2; immunology, 8; linguistics, 1; lithography, 1; mathematics, 251; medicine (mostly internal), 76; metallurgy, 69; meteorology, 6; mycology, 14; nutrition, 26; oceanography, 2; ophthalmology, 2; ornithology, 4; paleontology, 13; parasitology, 9; pathology, 78 (human, 23, animal, 3, plant, 52); pediatrics, 3; petrology, 1; pharmacology, pharmacy, etc., 71 (plus 21 pharmaceutical chemists); physiology (human and animal), 63; physiology (plant), 32; physics, 369; physics, nuclear, 8; pomology, 5; poultry science, 13; psychology, 211 (about 50 in clinical psychology, some in psychiatry, a few in

philosophy); radiology, 9; soil science, 25; speech, 8; statistics, 5; surgery (mostly specialized), 23; textiles, 1; toxology, 2; zoology, 142 (about 20 specified ichthyology).

### *Birthplaces of Indiana Scientists*

Approximately half of the scientists sketched were born outside Indiana. Of these, 188 were foreign-born. Canada yielded 42; Germany 26, Great Britain 19, other parts of northwestern Europe 27, eastern and southern Europe 32; China 14, other parts of Asia 13; Africa five; Latin America eight; and New Zealand two.

Of the American-born, New England produced 129, New York 178, Pennsylvania 157, New Jersey 34, Maryland 35, Virginia 24, and other eastern and southeastern states 51.

Kentucky yielded 69 (mostly from Louisville and other points near Indiana), Tennessee and West Virginia each yielded 21, Texas 38, and all other southern states 63. The Rocky Mountain states produced 87 and the Pacific states 65.

About half of the native Americans not born in Indiana were born in the other states of the Midwest: 300 in Illinois, 255 in Ohio, 125 in Michigan, 109 in Iowa, 75 in Wisconsin, 77 in Kansas, 64 in Missouri, 57 in Minnesota, 44 in Nebraska, and 34 in Dakota. Chicago alone yielded 94.

Of the 2,039 born in Indiana, Indianapolis accounted for 163; five places accounted for from 40 to 55 each; six places for from 20 to 27; 25 yielded seven, eight, or nine; 34 yielded five or six; 60 produced three or four; 103 places yielded two; and 256 places, one. Hence, 490 Indiana places are given as the birthplace of these scientists. Each county is credited with at least one. Many of the villages were small, and scores of them no longer appear on even detailed maps. Presumably, most of the 77 men and women who gave their birthplace by county only came from farms; and doubtless some who gave their birthplace as a village or town were actually born on a nearby farm.

First, let us consider the cities and towns which are outstanding. Those which yielded 20 or more, arranged alphabetically with the number, are: Bloomington 26, Evansville 31, Ft. Wayne 51, Indianapolis 163, Kokomo 27, Lafayette (including West Lafayette) 46, Logansport 21, Muncie 20, New Albany 20, Richmond 47, South Bend 41, and Terre Haute 55.

Places which yielded from seven to 19 scientists are: Anderson 15, Aurora 9, Bedford 10, Brazil 7, Brookville 7, Columbia City 9, Columbus 7, Connersville 11, Crawfordsville 14, Elkhart 14, Elwood 7, Frankfort 16, Garrett 7, Goshen 8, Greencastle 14, Greenfield 8, Hammond 8, Huntingburg 10, Huntington 14, Jeffersonville 11, Kendallville 12, La Porte 13, Lawrenceburg 7, Lebanon 12, Liberty 8, Linton 10, Madison 14, Marion 14, Michigan City 9, Mt. Vernon 13, Newcastle 8, Noblesville 8, North Manchester 14, Peru 8, Portland 8, Princeton 8, Remington 7, Rensselaer 7, Rockport 7, Salem 12, Shelbyville 11, Tipton 7, Union City 7, Valparaiso 7, Vincennes 13, Wabash 10, and Warsaw 8.

Some smaller places which yielded fewer than seven but were outstanding in proportion to their smaller populations are: Angola 5, Attica 5, Batesville 5, Bloomfield 5, Bluffton 6, Butler 5, Delphi 6, Economy 5, Fowler 5, Franklin 5, Goodland 5, Lagrange 5, Marshall 5, Moores Hill 5, Mulberry 4, Oakland City 4, Orleans 6, Paoli 5, Pendleton 5, Plainfield 6, Sheridan 6, Upland 5, Walkerton 5, Waynetown 4, Whiting 5, Windfall 4, Worthington 4, and Zionsville 5.

The cities, towns, and counties (if the birthplace is given by county only) which one or more of the scientists report as their birthplace are listed alphabetically in Chapter IV, with the number born in each. Lists of those born in each place have been compiled but are not published here. The names of the starred scientists are given by county and town of birth in the special section on starred scientists reprinted in Chapter V.

### *Regional Distribution of the Birthplaces*

The birthplaces of a large share of the scientists born in Indiana have been studied in detail. The number born in each county has been compared with the population to obtain the yield per 10,000. Counties have been grouped in various ways and compared with the distribution of various environmental conditions. Changes in the yield of various areas between earlier and later decades have been noted. In brief, the problem of why the scientists' birthplaces were not distributed in accord with the distribution of population at the time of their birth has been tackled from numerous angles.

In Chapter V are reprinted detailed studies of two groups of Indiana scientists, all those sketched in the seventh edition

of *American Men of Science*, and all the starred scientists. Here an abstract is presented of the findings presented there with the help of maps. The present summary also makes use of some evidence derived from detailed studies of birthplaces of non-scientists born in Indiana and of notables born in other states.

The birthplace distribution of 1,265 Indiana scientists reveals that of Indiana's 92 counties the 20 counties that yielded most in proportion to their population at about the time of birth of the average scientist were, in decreasing order: Monroe, Union, Wayne, Fayette, Montgomery, Switzerland, Clinton, Jasper, Newton, Tippecanoe, Hancock, Boone, Howard, Putnam, Washington, Hamilton, Noble, Johnson, Wabash, and Owen. These counties, except Switzerland, are on neither the northern nor the southern margins of the state. The three counties that produced one scientist per less than 1,000 population at about the time of their birth are in the east-central part of the state, Wayne County (of which Richmond is the chief city) and the two adjacent counties to the south, Union and Fayette. Three other high counties, which produced one scientist to little more than 1,000 people, are Tippecanoe (which contains Lafayette and Purdue University) and two adjacent counties, Clinton to the east and Montgomery to the south. Other high counties are Monroe (which contains Bloomington and Indiana University) and Newton and Jasper counties (about midway between Lafayette and Chicago), and Hancock County, just east of Indianapolis. Most of the counties which produced 69-89 scientists per 100,000 people are close to the most productive counties. Exceptions are Washington (containing Salem and Paoli, exceptionally fruitful towns) and Noble, near Ft. Wayne in the northeastern corner of the state.

Five of the ten counties which yielded fewest scientists in proportion to population border the Ohio River. Three others are also in southern Indiana. Northwestern Indiana has, however, two counties which rank low and three others which rank relatively low. The central third of the state, north and south, contains no county which ranks very low and only one, Rush, which ranks relatively low.

These data on the yield of scientists in proportion to population when they were born suggest that the presence of a

college where science is valued played an appreciable role. The counties where colleges were conspicuous in 1900 all rank high. Thus, Wayne, Montgomery, Monroe, and Tippecanoe counties, with Earlham and Wabash colleges and Indiana and Purdue universities, all rank in the upper tenth of the counties in yield. Putnam, with DePauw, also ranks in the upper one-sixth of the counties. Three other high counties are close to Purdue University (Clinton, Jasper, and Newton). Another high county (Hancock), although it has no college, is situated not far from several colleges. Switzerland and Noble counties are the most conspicuous exceptions to the rule that the high counties either have a college or are relatively close to one.

Although most of the college influence in increasing the yield of scientists in proportion to population is due to educational stimulation, mention may be made of the fact that many scientists born in college towns are the children of professors.

The distribution of the birthplaces of the 81 scientists who have been starred in *American Men of Science* as distinguished for research has been analyzed in more detail than that used for the non-starred scientists just discussed. As the starred scientists are a distinctly more distinguished group than the non-starred scientists, the distribution of their birthplaces throws more light on factors conducive to the production of leaders. Half of the state's counties yielded no starred scientist and a quarter of them yielded only one each. By contrast, Marion County (which contains Indianapolis) yielded five, Switzerland, Johnson, and Wayne counties each four, and Jefferson, Union, Hancock, Allen, and Vigo three each. The yield by quarters of the state's population at the median date of the birth of these 81 scientists (1875) is as follows: The southeast quarter was the birthplace of 29 scientists, giving a yield of 14.5 per 100,000 population. The northeast quarter yielded 23, or 11.5 per 100,000 population. The southwest yielded 19, or 9.5 per 100,000. The northwest yielded 11, or 5.5 per 100,000. Thus, the southeast quarter did nearly three times as well as the equally populous northwest, and the northeast fully twice as well. The eastern half of the state's population yielded 63.5 per cent of the total number; the southern half yielded 58.5 per cent.

The unglaciated part of the state yielded eight starred

scientists, or at a rate of only 4.8 per 100,000 population. The relatively prosperous lower Wabash Valley Lowland of the southwestern part of the state, south of Terre Haute, yielded only one starred scientist. These nine southwestern counties yielded starred scientists at the rate of one per 220,000 people. Fifteen northwestern counties having a combined population of 250,000 people yielded none, although two contain Wabash College and Purdue University. Thus, 15 counties east and southeast of Indianapolis having a combined population of 200,000 yielded 25 starred scientists or one per 8,000 people, while a similar number of counties in the northwest having then 50,000 more people yielded none.

### *Theories as to the Contrast in Yield of Notables*

Maps have been made of the yield of the starred scientists and other scientists and of notables of various other sorts (especially persons sketched in *Who's Who in America*) per unit of population at about the time of their birth. Likewise, many maps of environmental conditions have been made. Below is a summary of some correspondences and disagreements. (Details on the climate contrasts are presented in Visher: *Climate of Indiana*, 511 pp., Indiana University 1944.)

1) It is often claimed that differences in climate influence the production of notables. The evidence on this point in Indiana is of interest. Climatic contrasts in Indiana are small; the two sections which differ most widely, the Ohio River Valley and the littoral of Lake Michigan, display no correlation in the yield of scientists. However, the sixth of the state possessing the longest hot summer, the southwest, has yielded far fewer scientists proportionately than has the opposite corner of the state, which is coolest. The most productive part of the state is, however, not the coolest. Hence, climatic differences clearly are not significant in Indiana in this respect.

2) The eminent historian Frederick J. Turner declared, "It often seems to be largely a matter of topography; the level lands yield leaders as well as crops, while the rugged lands produce few of either." The inadequacy of that theory is proved in Indiana, where much of the nearly level land is relatively unproductive of leaders, while some of the most productive areas are fairly hilly. Indeed, though the unglaci-

ated, especially hilly part of the state is largely poor in both crops and leaders, it is no less productive of leaders in proportion to population than are some of the most level lands. One of the counties which has stood high in the production of leaders in proportion to population is one of large local relief (Switzerland County).

3) Another often-held theory is that "as wealth increases, so does the yield of leaders." Such a correlation does prevail in the blue grass regions of Kentucky and Tennessee, and in various other states and regions, but not in Indiana. The parts of Indiana having the greatest tangible wealth per average square mile or per capita are not the most productive of scientists; large sections of relatively rich and prosperous land have yielded few. For example, Benton, Howard, Rush, Blackford, Knox and nearby rich counties with a combined population of much more than 200,000 yielded not one starred scientist. The parts of the state that have yielded coal in abundance are conspicuously unproductive, as are some of the industrially active areas. Although only one of the state's ten exceptionally poor counties has yielded relatively many notables in proportion to population, the evidence from Indiana is sufficient to indicate that increased areal material does not necessarily result in a larger yield of notables.

4) Another explanation of regional contrasts in the yield of notables is that notables are a product of relatively advanced communities. "Frontiers can not be expected to produce leaders, as the people are engaged in hewing homes out of the wilderness." In Indiana this theory receives some support. The southeastern part of the state, near Cincinnati and northward to Indianapolis, the first part to be well developed, includes most of the more productive counties. The northwestern section of the state, the most recently developed, has produced relatively few leaders.

But the inadequacy of this theory is almost proved by two facts: (a) the part of the state which was most productive 1830-80 has in recent decades become relatively unproductive; and (b) the part of the state first settled—and continuously prosperous since 1830, the southwestern, the lower Wabash Valley, in which is located Vincennes, the oldest settlement in the state—has been relatively unproductive of leaders. Not one starred scientist has been born in the region south of Terre Haute and Washington. Crawfordsville

was another early cultural center which has yielded no starred scientists, although several have graduated from Wabash College. Tippecanoe County, containing Purdue, likewise has yielded no starred scientist—though numerous non-starred scientists.

5) Another theory is that notable leaders come largely from areas which are educationally favored. In Indiana, for example, the four counties containing Earlham and Franklin colleges and DePauw and Indiana universities yielded ten starred scientists, one-eighth of the total number, although at the average date of birth of the scientists these counties contained only 95,000 people, or somewhat less than one-twentieth of the state's population. But on the other hand, five of the six counties which had the highest yield of starred scientists in proportion to population lacked colleges. These five especially productive counties are Union, Switzerland, Jefferson, Hancock, and Parke, with a total yield of 13 starred scientists from a population of 82,000, or an average of one scientist for 6,300 people. These five counties yielded starred scientists at about a 50 per cent higher rate than did the highest four counties with colleges.

#### *Yield of Scientists from City, Town and Country*

Since geographic conditions in sizable regions in Indiana do not correlate closely with the yield of notables, it is desirable to consider types of land use,—specifically, the relative productivity of city, town, and country. Birthplaces have been located in as much detail as possible. A letter was sent to numerous notables asking if they were reared on a farm, in a village or town, in a small city, or in a large city or a suburb. At the time when most of these men and women were born, Indiana was predominantly rural and very few children were born in city hospitals. Hence, many were born on farms. However, towns did much better than did the farms. Likewise, the small cities yielded more leaders per capita than did the larger ones, except of men of exceptional distinction.

Especial note was made of the contribution of county seats and college towns. The average Indiana county seat yielded at more than three times the rate for the state. College towns (nearly all also county seats) did exceptionally well, more than twice as well as the average town.

This correlation between type of place of birth and yield

of notables is far greater than the correlation between yield and topography, soil, climate, material resources, or age of settlement. It reflects the relative attractions of certain types of places for the parents of notables. At the time that most of the notables here studied were born, a large share of the more alert, ambitious people of Indiana apparently were living in towns.

Occupational groups must be considered also. What are their contrasts in the yield of notables? Data were obtained by questionnaire from many scientists as to the occupations of their fathers. The replies reveal that in proportion to their numbers in the population according to the census nearest the birth of the average notable, professional men fathered more than twice as many notables as did business men, nearly 20 times as many as did farmers, about 45 times as many as did skilled laborers, and more than 1,000 times as many as did unskilled laborers. Farmers fathered one-fourth fewer than their share. In other words, only one unskilled laborer in about 38,000 fathered a son or daughter sufficiently noteworthy to win a place in *Who's Who*; one skilled laborer in 13,000 had that distinction; one business man in 62; one professional man in 27; and one Protestant clergyman in 15.

#### *Why Do Few Homes Yield Leaders?*

It is therefore apparent that a small portion of the men of Indiana fathered a large share of the leaders. The interpretation of this concentration is in dispute. Advocates of the theory that environmental influences dominate assert that the classes that produced more leaders did so because they could offer better opportunities for cultural and physical development. Conversely, advocates of the theory that hereditary influences are predominant declare that children of unskilled laborers, when adopted into homes of professional men or otherwise given comparable opportunities, nearly always fail to become leaders. They likewise declare that the superior economic status of the fathers of most leaders is the result of their superior qualities of mental alertness, earnestness, ambition, and vitality.

Advocates of the theory that social selection is very important find much support in such data as are here summarized. They point out that the mentally alert people are found chiefly in occupations where their mentality is most advan-

tageous, while the mentally dull are found chiefly in occupations calling for physical strength or routine work. Social selection of another type is illustrated by immigrants of exceptional ability. For example, many eminent Americans are German descendants, especially of the liberals who came soon after the unsuccessful revolution of 1848. Scotland, both directly and via north Ireland (the Scotch-Irish), also has supplied many ancestors of eminent Americans. But according to much evidence, by far the largest group of American leaders are descendants of emigrants from East Anglia, England, the district which has yielded many eminent British as well as the ancestors of most of the Puritans of New England, Quakers, and the Cavaliers of Virginia. The westward spread of the descendants of these immigrants clearly helps to explain the geographical contrasts in the yield of notables. Conversely, their partial submergence numerically in various areas by less productive stocks largely produced the subsequent decline in the per capita yield of notables in those areas.

A seventh theory is that outstanding leaders such as the starred scientists come from families that are especially alert, earnest, and ambitious, without respect to their racial backgrounds, and that such people tend to congregate in places of comparative opportunity for them to use their talents. Bits of evidence from the data as to the Indiana starred scientists which support this theory include: When southeastern Indiana was relatively favored, it produced many leaders, but because of the depletion of soil and forest wealth, and especially when greater opportunities opened elsewhere, many of the more ambitious people moved away. As a result, southeastern Indiana has yielded few starred scientists for many years. For example, none were born since 1880 in four of the southeastern counties which were especially productive earlier (Crawford, Jefferson, Switzerland, and Union). Likewise, not one was born since 1880 in the entire unglaciated part of the state. Indeed, all 42 counties south of Wayne, Johnson and Vigo have yielded only two since 1881, one in 1887 (Mann), and the other in 1901 (Twitty).

Another evidence of the selective migration of the parents of the starred scientists is that relatively many starred scientists were born in county seats, the local centers of greatest opportunity for talent. The considerable number born in

college towns is another evidence. The fact that of the 30 born in Indiana since 1880, 12 were born in the Gas Belt of the late 1880's and 1890's is significant. The boom experienced there attracted relatively many ambitious people. Both of Indiana's Nobel Prize winners, Urey and Stanley, were born in the northern half of the state since 1892.

Another theory to explain the contrasts in yield of notables is that, from young people with the requisite ability, leaders come if they receive adequate encouragement from those close to them and from stimulating teachers, provided opportunities are afforded to them to develop their talents. Conversely, few become such leaders if sufficiently stimulating teachers are not available, and if they are not encouraged to prepare themselves adequately, and if opportunities to serve as leaders are not available. This theory has much support in Indiana.

#### *Some Conclusions on Where the Scientists Come From*

The areas which yield the most scientists are those which contain the most mentally alert, ambitious, persistent, and energetic people possessed of high ideals. Such people seek opportunities to use their abilities; they appreciate congenial associates and therefore congregate in desirable towns and in choice residential districts or suburbs.

Detailed studies here summarized strongly indicate that physical or geographic environmental influences in as favored a land as Indiana often affect indirectly the geographic yield of leaders by concentrating certain types of people rather than directly by affecting diet, occupation, health, and energy. A region relatively poor in resources usually comes, in time, to be peopled largely with those who are relatively lacking in ambition; the more favored areas attract people possessing relatively large amounts of resourcefulness and energy. In Indiana, the educational and political centers and the choice suburbs and residential sections of prosperous cities are favored areas. Notables and their parents are exceptionally mobile, alert to better their opportunities.

Men and women of distinction are a product of both environment and heredity, certainly not predominantly of one of these. It is essential that certain physical and mental qualifications be contributed by heredity. But numerous persons who possess the biological potentialities fail to become

distinguished because of the lack of favorable environmental conditions.

Of great consequence in a youth's choice of a vocation—meteorology, merchandising, teaching, or professional gambling, for example—is encouragement from one or more persons whom he deeply respects. Such encouragement may change the direction of his life. Stimulating high school and college teachers are particularly significant. Specific illustrations of stimulating teachers are given in the discussion of starred scientists. Also significant is the influence of other highly-respected people in the community. The scientist's mother may exert a profound influence. A considerable number of scientists were children of educators and scientists. The success of others from the childhood community also has a bearing. Doubtless this influence helps to explain why certain small Indiana places yielded first one outstandingly successful scientist and later more scientists.

Highly significant in the yield of a particular place are the opportunities there for work in science. Some Indiana cities and towns have relatively many opportunities for able and earnest young people. This helps to explain the important yield of college towns, notably Lafayette and West Lafayette, where Purdue University and the United States Experiment Station operate.

### *Indiana Colleges and the Education of Indiana Scientists*

Of these scientists, many graduated from an Indiana college or university. Indiana University conferred the college degree on 532, Purdue on 486, DePauw on 212, Wabash on 127, Notre Dame on 108, Earlham on 95, Butler on 75, Valparaiso on 51, Indiana State Teachers (Normal) College on 46, Rose Polytechnic on 43, Manchester on 31, Hanover on 21, Franklin on 19, Indiana Central on 15, Evansville on 11, Marion on ten, Taylor and Tri-State each on nine, Ball State, Goshen, and Oakland City each on eight, Moores Hill on six, Danville on four, Winona on two, and St. Joseph's and St. Mary's each on one. There were 1,924 bachelors' degrees from Indiana institutions. (Several scientists received a second college degree from a second Indiana school. This was especially true of graduates of Valparaiso.)

Native Hoosiers comprise the bulk of the graduates of the state-supported schools. More came from outside the state

to attend Purdue University than to attend Indiana University. The non-state-supported institution with the largest percentage of its alumni from other states is DePauw; the next is Notre Dame; and the third, Earlham.

Of the scientists here studied, 784 received doctorates in Indiana: 361 from Purdue, 328 from Indiana University, and 95 from Notre Dame. All but a few of Notre Dame's total went to non-Hoosiers, as did most of Purdue's. By contrast, nearly two-thirds of Indiana University's doctorates went to Hoosiers. Purdue and Notre Dame both conferred doctorates on many of their faculty; a large share of Notre Dame's science faculty consists of local Ph.D.'s, as does almost half of Purdue's. Indiana University, however, has awarded few Ph.D.'s to its own faculty.

In the total number of their alumni sketched, Purdue and Indiana are far ahead. The institutions which have yielded most in proportion to total enrollments of men students are, however, Wabash, DePauw, Earlham, and Indiana, in that order. Wabash, Earlham, and Indiana were especially notable before 1910. In recent years, DePauw, first, and Purdue, second, have been outstanding. But Purdue has had many more men students in recent decades than has any other Indiana school—until recently nearly twice as many as Indiana University has had. As *Indiana Scientists* sketches many engineers and agriculturists, as well as the more conventional types of scientists, many of Purdue's alumni are included. Indeed, nearly a quarter of the scientists sketched are Purdue alumni or one-time faculty members.

In tabulating the place of college training of these scientists, it was interesting to note what a large fraction graduated near their birthplace. This illustrates again the importance of nearby colleges to a community's yield. The local reputations of Wabash and DePauw appear to have been especially good, as relatively few natives of their localities graduated elsewhere. In contrast, most of the 47 born in Richmond graduated outside of Indiana, as did many of the 163 born in Indianapolis. A considerable number from Lafayette and West Lafayette graduated at Indiana University, and several from Bloomington graduated at Purdue.

Characteristic of embryo scientists are that they are observing and earnestly seek better conditions. These traits tend to encourage them to attend colleges away from home,

whose shortcomings may be less evident to them than are those of their local colleges.

Tabulation was made of only 139 masters' degrees, those conferred as the highest degree obtained. Of these, Indiana University conferred 76, Purdue, 54, and Notre Dame, nine. Each of these schools conferred masters' degrees on many other persons who later received a doctorate.

In Chapter III, some details concerning the contribution of the scientists of each of the Indiana colleges are given.

#### *These Scientists' Contacts With Indiana Educationally*

A series of tabulations were made relating to the educational contacts of these scientists. For example, of 2,003 born in Indiana, 585 were neither college-educated nor employed in Indiana, while 83 returned to Indiana for employment after having college training elsewhere.

Of 2,003 natives, 533 were both college-trained and employed in Indiana. A total of 151 natives received both college and graduate training in Indiana but found employment elsewhere.

A total of 292 natives of other states or countries who are here sketched as Indiana scientists graduated from Indiana colleges with the bachelor's degree but found work elsewhere. Persons who came to Indiana for their graduate training and then left the state totaled 706. (About half of these received their doctorate at Purdue.) Non-natives receiving both college and graduate degrees in Indiana but not subsequently employed in Indiana total 86. These various groups of non-natives who were not employed in Indiana total 1,084. Indiana alumni not Hoosiers but who were later employed in Indiana number 323.

#### *Indiana Places of Employment of Scientists*

The number of scientists depends to no small degree upon the number who can make a living as scientists. Many people who are not scientists have much curiosity and desire to discover new truth. Many also possess two other qualities needed: initiative and perseverance. Some of these might have become scientists if favorable conditions had prevailed. Consequently, the presence or absence of opportunities for able young scientists is highly significant.

Indiana has been the birthplace and the place of college

education of many more scientists than the number to which it has afforded adequate opportunities in science to earn a living. Consequently, many scientists have had to enter non-scientific endeavors—largely teaching—or go to other states for employment.

A tabulation was made of the type and place of employment of those employed in Indiana. Educational institutions employed 1,528 and industry 853. Industrial firms are employing a sharply-increasing number. For example, a competent elderly Indiana scientist believes that in 1895 fewer than 25 scientists were working in Indiana industry in contrast to several hundreds in 1950.

Purdue University has been the leader by a wide margin in the number it has at one time or another employed: a total of 625. Indiana University has employed not many more than half that number, 349. Notre Dame has employed 110, DePauw 60, Wabash 51, Butler 45, Earlham 41, Rose Polytechnic 33, Valparaiso 33, Indiana State Teachers 27, Ball State 20, Evansville 19, Franklin 16, Hanover 11, Indiana Central 11, Manchester ten, Taylor ten, Marion nine, Vincennes eight, and Goshen seven. Employing four or five each have been Oakland City, St. Mary-of-the-Woods, Tri-State, and Danville.

Purdue's outstanding leadership in the number of Indiana scientists employed reflects at least three conditions. One is the aforementioned many opportunities for scientists in the United States Experiment Station there and in part-time teaching in the University, one of the largest in agriculture and engineering. A second is that masters' degrees or doctorates furnished part of the compensation to many of these scientists. A third explanation of the Purdue total is the fact that many remained for only a short time, perhaps no more than the two years' minimum necessary for listing in this book. Purdue has employed briefly numerous subsequently well-known scientists. Some of the faculty have remained for many years, but on the average, the annual turn-over has been relatively large. This is also true for Notre Dame and Valparaiso. Purdue's record of attracting professors from other Indiana institutions is notable.

Although Purdue has led by a wide margin in the number of scientists employed, Indiana University has led in the distinction of some of its faculty. Consistently since starrng

commenced in 1906, Indiana University has had most of the starred scientists in the state, generally over two-thirds of the state total. It has also had the only members of the National Academy of Sciences. Members of its faculty who have risen high in the scientific world after leaving are also far more numerous than for the other schools.

Indiana scientists who taught two or more years in Indiana public or, more frequently, high schools total at least 122. (A considerable number who do not mention—in the brief biographical sketches used in the compilation of the sketches of this book—that they taught in public or high schools are known to have done so.)

Among industrial firms in Indiana, two have been outstanding in employment of the scientists sketched. The Standard Oil Company of Indiana has employed 173, and Eli Lilly and Company 110. Both have employed many experts who have contributed notably to the advancement of science. Indeed, each has had a few starred scientists. A large majority of the Standard Oil scientists were from other states, as were somewhat more than half of the Eli Lilly group. But both companies have also employed many Indiana scientists, especially Ph.D.'s. (A total of 228 Ph.D.'s from the University of Chicago are sketched in this volume. Most of them have been employed by Standard Oil of Indiana, Eli Lilly, Purdue, or Indiana University.)

The third Indiana corporation in number of Indiana scientists employed is Commercial Solvents Company of Terre Haute, with 50. Concerns which have employed about a dozen are General Electric (all Indiana plants), Mead-Johnson (Evansville), Servel (Evansville), Pitman-Moore (Indianapolis), and Schenley (Aurora). Companies which have employed seven to nine are Bendix (South Bend), Magnavox (Ft. Wayne), Miles (Elkhart), Sinclair, and three Indianapolis firms, Presto-Lite, Reilly Tar, and Swan-Myers (now part of Abbott Laboratories, Chicago). Concerns employing four or five are Diamond Chain, Central Soya, Glidden, Grasselli, Linde, Seagrams', Studebaker, Van Camp, Universal Atlas Cement, and U. S. Rubber (Indiana plants).

More than a score of other Indiana companies have employed two or three of these scientists. Included are Allison, American Maize Products, and Conn (Elkhart). Many others employed one, a total of 109 in Indiana.

The special study reprinted in Chapter V of 2,653 scientists born, trained, or employed in Indiana and sketched in the seventh edition of *American Men of Science* presents some interesting details on employment. In brief, 63 per cent were employed by colleges or universities, 22.5 per cent by industry, ten per cent by government; nearly two per cent were "privately employed"; and nearly one per cent were employed by foundations and museums. Somewhat more than half of the chemists were employed by industry, but less than a sixth of the physicists were thus employed. Nearly all of the mathematicians were teachers, only about three per cent being employed by industry. Indeed, aside from chemists, physicists, engineers, bacteriologists, pharmacologists, and geologists, industry employed few of these scientists. Industry employs far more of the younger scientists than of the older.

Only six firms outside Indiana employed in 1943 more than six Indiana scientists; Dupont 40, Standard Oil Research Co. 14, Dow Chemical ten, American Cyanamide ten, Monsanto eight, Abbott Laboratories seven, and U. S. Rubber, Radio Corporation of America, Bell Telephone, Eastman Kodak, and Aluminum Co. of America, each six. In 1943, 221 firms employed one each, most of them not in Indiana. (No tabulation was made of the persons sketched in this volume as to employment in out-of-state concerns, but it is believed that the totals for 1950 were notably larger than those for 1943.)

### *Some Conclusions*

Indiana has been the place of birth, of higher training, or of employment of numerous scientists, including some of the nation's most-honored. Some 490 Indiana cities, towns, and hamlets are designated by these scientists as their birthplace, and each Indiana county has been the birthplace of one or more. Some areas have, in proportion to their past populations, yielded exceptionally large numbers.

Contrasts in the yield of this valuable resource, scientific leadership, are of such profound social significance that prolonged, detailed studies of their causes are not only justified but highly desirable. The present study supplements, extends, and supports other studies and conclusions. Four of these conclusions may be summarized here.

(1) Encouragement or stimulation is deeply significant in the production of leaders. Indeed, although some business

men and a few others have bragged that they were "self-made," the evidence clearly indicates that no scientists are self-made. Encouragement is essential to the development of a scientist. This encouragement may come from one or more sources. If it comes from the immediate family, that is a great help. Some receive it from an especially stimulating high school teacher or college professor. Many scientists have acknowledged that encouragement from their mother was especially significant in their earlier years while a college teacher played a major role in their specialization and later career. Sometimes the stimulus comes from a friend or from a cousin, aunt, or uncle. The proved great significance of encouragement justifies each of us to be generous in encouraging our own more promising students and young friends. A few appreciative words may alter their lives.

(2) A second major influence facilitating the production of scientists is the presence of opportunity to obtain adequate training—and this presupposes the opportunity to obtain the benefits of studies made by previous workers in the field. The presence of several excellent educational institutions in Indiana is therefore highly significant. Since the most effective form of education is working individually with an able, enthusiastic specialist—not mere 'book learning' or mass lectures—the type of instructor available is of vital import. All interested in increasing the number of scientists should remember that individual instruction of a high order is almost essential.

(3) As nearly all scientists must earn a living, the opportunity to do so is essential if men and women are to become scientists. Employment close at hand is of great assistance, especially to beginners. It is evident that in the present world there is great need for more scientists and for greater scientific achievement in diverse fields. Hence, scientists should be more adequately recognized and should be afforded better opportunities for their work, which, in nearly all instances, is for the benefit of mankind and not solely for their personal gain. It is a reflection on the good name of Indiana that she has afforded comfortable living opportunities for so few scientists, except, perchance, indirectly, through teaching positions.

(4) Most fundamental in a favorable yield of scientists is the presence of a favorable biologic and cultural background.

An ever-increasing mass of evidence indicates that leaders in science come from families well above average in ability, earnestness, vigor, and ambition. Some productive families are found in unexpected places, often because the mother, the most significant parent biologically and culturally, married out of her cultural group. However, families which yield leaders are most numerous in favored communities, for example, college towns, county seats, and attractive suburbs. Such families are also relatively numerous in certain occupational groups, especially in the professional class and particularly among educators and the clergy. Productive families are also more numerous in some human stocks than in others, including, in Indiana, the Quakers, the Scots, the Yankees, and the early Germans. Wherever they are, it is evident that families distinctly above average biologically and culturally have an opportunity to contribute more than their proportionate share of leaders, and should be strongly encouraged to make earnest efforts to do so.

Of 2,596 scientists sketched in this volume who report being married, about a fourth have no children and nearly another fourth have only one. Exactly 40 per cent have two children and exactly 20, three. Hence, fewer than one-tenth have four or more children (55 have five, 11 have six, four have seven, and four have eight or nine).

If three children from each marriage are required to maintain the population, more than two-thirds of these scientists will become biologically extinct unless their offspring have more children than they themselves have had.

Obviously, the future of our country is somber if the bearing and rearing of the next generation is left largely to families poorly qualified biologically and culturally to rear children.

The deductions just mentioned are not merely academic. Everyone of us can aid somewhat. Let us resolve to do better than we have hitherto done with respect to encouraging potential scientists, partly by giving them more individual attention, and partly by increasing their opportunities to earn a living in science. Last, but not least, we should all endeavor to increase the number of children born into families qualified to produce future scientists.

## CHAPTER II

### BRIEF BIOGRAPHICAL SKETCHES OF INDIANA SCIENTISTS

#### *Personal Information, Field of Study, and Educational and Employment Experience*

- ABBOTT, George A(lonzo), *Chemistry*. Alma, Ill, 7/7/74; m. 10, c. 2. B.S., DePauw, 95; Ph.D, Mass. Inst. Tech, 08. North Dakota, head dept, 10-47.
- ABBOTT, John B., *Agriculture*. East Bethel, Vt, 1/5/83. M.S, Purdue, 09. Purdue, exp. sta, assoc. soil fertility, 08-14; deputy state chem, Ind, 07-09.
- ABBOTT, R(aymond) B(arrington), *Physics*. Newton, Kans, 12/25/73. B.S, California, 08, M.S, 12, Ph.D, 19. Purdue, 21-47, prof, 34-47. Ind. Acad. Sci. (v.p, 44).
- ABBOTT, T(albert) W(ard), *Chemistry*. Otwell, Ind, 8/21/92; m. 30, c. 2. A.B, Indiana, 18; Ph.D, Illinois, 28. Illinois, prof, 28-, dean, 45-.
- ABEL, John J(acob), *Pharmacology, Physiological chemistry*. Cleveland, O, 5/19/57, died, 38. Ph.B, Michigan, 83. Ind. high schs, 79-80; Hopkins, prof, 93-32, dir. endocrine res. lab, 32-38. Natl. Acad. Sci; Am. Assn. Advancement Sci. (pres, 32).
- ACHESON, L(ouis) K(ruzan), *Mechanical engineering*. Brazil, Ind, 12/31/99; m. 23, c. 2. B.S, Rose Poly. Inst, 22. Kruzan & Co. (Ind.), 23-28.
- ADAMS, C(hester) E(lgin), *Organic chemistry*. Myrtle Point, Ore, 6/7/98; m. 26, c. 2. A.B, Oregon, 20; Ph.D, Iowa State Col, 25. Standard Oil Co. Ind, 27-, sect. leader, 47-. Waxes, antiseptics.
- ADAMS, E(dgar) M., *Toxicology, Biochemistry*. Clinton, Ind, 12/29/08; m. 37, c. 3. A.B, DePauw, 30; Ph.D, Cincinnati, 34. Dow Chem. Co, 34-. Chemotherapy of pneumonia.
- ADAMS, E(lmer) W(ade), *Organic chemistry*. Deer Park, Tex, 10/7/97. B.S, Illinois, 19; Ph.D, Wisconsin, 24. Standard Oil Co. Ind, 25-. Insecticides; lubricants.
- ADAMS, H(enry) R(ichard), *Soils*. Mason, Mich, 1/29/96. B.S, Mich. State Col, 21, M.S, 24. Purdue, exp. sta, 24-26.
- ADAMS, James E(dward), *Soils*. Lee's Summit, Mo, 7/5/98; m. 24. A.B, Wm. Jewell Col, 20; M.S, Purdue, 22; Ph.D, Iowa State Col, 36. Purdue, instr, 20-22.
- ADAMS, (Samuel) Clifford, *Hydrology, Soil mechanics*. Rockville, Ind, 2/12/12; m. 38. A.B, Hanover Col, 35; Ph.D, Iowa, 42. Hanover, 35-, assoc. prof. geol, 45-. Soil erosion; ground water.
- ADDINGTON, Arch R(ombough), *Geology*. Randolph Co, Ind, 2/23/94; m. 16, c. 2. A.B, Indiana, 22, A.M, 25. Indiana, instr, 23-28; Calif. State Col, prof, 28-. Subterranean drainage features of Indiana.
- AHRENS, W(alter) E., *Forest pathology*. Huntingburg, Ind, 8/28/10. B.S.A, Purdue, 32. U. S. Dept. Agr, 33-. Dutch elm disease.

Universities are not generally so designated, but colleges are: Purdue, Rutgers; but Evansville Col, Vassar Col.

States, when used alone to designate universities and colleges, are spelled out, but when used as locations are abbreviated: Indiana for Indiana University, Iowa for State University of Iowa, but U. S. Naval Ordnance Plant (Ind.) and Studebaker Corp. (Ind.).

Indiana colleges and universities referred to herein, with their principal locations if different from their names: Ball State Teachers Col, Muncie; Butler, Indianapolis; Canterbury Col. ## CHAPTER III

### SUMMARIES AS TO CERTAIN SCIENCES AND INDIANA INSTITUTIONS

#### MATHEMATICS IN INDIANA

*By Will E. Edington, DePauw University*

In order to get a proper perspective of mathematics in Indiana, it is necessary to realize the chaotic condition of nineteenth-century education. Although Indiana University, Hanover College, Wabash College, and DePauw University were founded before 1840, there were no tax-supported schools to prepare students for college work until after 1867, and few before 1885. In 1867 the legislature passed a law enabling communities to set up tax-supported schools. Such preparatory schools as existed earlier were academies and seminaries established by church organizations or by individuals. All the colleges, however, provided preparatory training. Indiana University did not abolish its preparatory school until 1890, and it was about 1900 before DePauw and other Indiana colleges ceased to give this work.

Enrolment data throw much light on the conditions during the last century. Wabash College, for example, had an enrolment of 113 in 1837-38, of whom only 31 were doing college work. For years Franklin College never had more than 36 in its collegiate department. Wabash had a total of 143 alumni in 1861, twenty-nine years after its founding. The number of graduates from Indiana University did not total a thousand until 1875. In 1890 at DePauw the collegiate enrolment was 418, that at Indiana University 339, and that at Purdue, 238. The preparatory enrolments in 1890 were DePauw, 338, Indiana, 99, and Purdue, 111.

Several other factors influenced the amount of work done in mathematics during the earlier decades. First, practically all colleges required Latin and Greek both for admission and as college work. Wabash College, for example, required four years of Latin and two of Greek for the A.B. degree, in addition to the passing of an entrance examination in these classical studies. The A.B. and the B.S. degrees both required two years of mathematics and one year of physics, but the preparatory department was largely concerned with Latin and Greek. At Indiana University, it was 1873 before mathe-

matics or science could be substituted, even in part, for Greek in the entrance qualification.

A second factor retarding work in mathematics was that it was taught chiefly as an aid to computation and surveying and to the understanding of natural science, especially astronomy. Astronomy was generally studied in the senior year, following some mechanics in the junior year. Little mathematics other than arithmetic was given anywhere in Indiana in the first half of the century. Practically the only textbooks in algebra, trigonometry and analytic geometry then available were translations and revisions of French textbooks. This situation prevailed throughout the United States until about 1875. In fact, until there were numerous high schools, about 1890, most colleges taught elementary algebra and plane and solid geometry as college subjects.

A third and dominant factor retarding mathematics was that practically all the early college teachers were trained for the ministry. Such professors might teach mathematics briefly and then teach Greek or some other subject entirely foreign to mathematics. The strictly professional mathematician did not exist in Indiana until after 1850. Indeed, the early scientists of Indiana were naturalists and scholars, not botanists, geologists, mathematicians, etc.

The first teacher of mathematics in Indiana to carry the title of professor of mathematics was John Hopkins Harney (1806-68). He was professor of mathematics, natural philosophy and astronomy at Indiana University from 1827 to 1832, when he went to Hanover for five years as professor of mathematics, natural and mechanical philosophy, and chemistry. Bishop Matthew Simpson (1811-84) taught the first courses in mathematics at DePauw. He was followed by William Clark Larrabee (1802-59), who later became the first state superintendent of public schools. John Steele Thomson (1804-43) was the first professor of mathematics at Wabash, 1834-43. The first professor of mathematics (and natural philosophy) at Franklin was Rev. John B. Tisdale, appointed in 1846. At his death a year later, he was succeeded by John S. Hougham (1821-94), who remained until 1863. Hougham later became the first professor at Purdue (1872).

At Hanover, S. Harrison Thomson served from 1844 to 1877 and Frank Lyford Morse from 1876 to 1900. DePauw honors John Price Durbin John, who taught mathematics from 1882

to 1889, when he became president. He had served as president of Brookville and Moores Hill Colleges before coming to DePauw. DePauw's second great teacher of mathematics was Wilbur Vincent Brown, who served from 1885 until his death in 1928. Indiana University's first outstanding teacher of mathematics was Daniel Kirkwood, appointed professor of mathematics and civil engineering in 1856, remaining for thirty years. He became one of America's leading astronomers, writing 129 articles, mostly on astronomy. Succeeding Kirkwood was Joseph Swain, who received the first M.A. in mathematics from Indiana University. Swain went to Stanford University in 1891 with David Starr Jordan, but returned to Indiana University as president in 1893, continuing until he went to Swarthmore College as president.

During the years 1891-96, four of Indiana's greatest teachers of mathematics became associated. Drs. Robert Judson Aley, Schuyler C. Davisson, Ulysses S. Hanna, and David A. Rothrock, all graduates of Indiana University, became its celebrated "Big Four" as teachers of mathematics. Davisson began his work in 1890, Aley in 1891, Rothrock in 1892, and Hanna in 1895. The group remained intact until 1909, when Aley became state superintendent of public instruction and soon thereafter president of the University of Maine—and still later president of Butler University. The other three remained at Indiana University until they reached retirement. The great teachers of mathematics at Wabash College were John L. Campbell, Jacob Norris, and Jasper Asaph Cragwall. Campbell began his work in 1849 and remained until his death in 1904, but in his later years he taught physics and astronomy, not mathematics. Norris was at Wabash from 1876 to 1891. Cragwall came to Wabash in 1900 and retired in 1929. One of the earliest professors of mathematics at Earlham College was Erastus Test, who later went to Purdue.

The first professor of mathematics at Purdue was William B. Morgan, who served one year, 1874-75. He was succeeded by David G. Herron, who served till 1883. Moses C. Stevens then taught mathematics, until he retired in 1902. Other great teachers at Purdue, who began their service there before 1900, were Thomas Greene Alford, who served 1892-1917; Erastus Test, 1889-1910; Alfred Monroe Kenyon, 1898-1921; and Clarence Abiathar Waldo, 1895-1908. Waldo was one of

the three mathematicians in Indiana before 1900 who had a national reputation. He began his work in Indiana at the Rose Polytechnic Institute in 1883, where he served as acting president twice before he went to DePauw for four years as head of the department of mathematics.

The three mathematicians of national reputation before 1900—Henry Turner Eddy, Arthur Stafford Hathaway, and Waldo—served at the Rose Polytechnic Institute. Eddy was president from 1891 to 1894 and was one of thirteen Americans to present papers at the Mathematics Congress held at the Chicago World's Fair in 1893. Hathaway succeeded Waldo in 1891 and remained at Rose until retired (1920). He did considerable research and was active nationally in mathematics.

Indiana State Teachers College honors among its earlier prominent teachers, Oscar Lynn Kelso and Frank Rawdon Higgins. Other notable early teachers were E. N. Johnson of Butler University and E. D. Grant of Earlham College. However, the number of Indiana mathematicians who produced research before 1900 is very small. The first woman to become head of a department of mathematics in Indiana was Mrs. Lizzie S. Byers, who served in that capacity at the Indiana State Normal School from 1890 to 1893.

The last quarter of the nineteenth century saw a general quickening in the study of advanced mathematics throughout the United States. Johns Hopkins University was founded in 1876 primarily to encourage graduate study and research. The reorganization of the University of Chicago in 1892 was with the intention of making it primarily a graduate school. The first national mathematical organization, the American Mathematical Society, in 1891 succeeded the New York Mathematical Society founded in 1888. The *American Journal of Mathematics*, founded at Johns Hopkins University in 1878, was the first American mathematical research journal. The *Bulletin of the New York Mathematical Society*, later to become the *Bulletin of the American Mathematical Society*, began publication in 1891, and the *Transactions of the American Mathematical Society* first appeared in 1900. The *Annals of Mathematics* began publication in 1884. Finally, the *American Mathematical Monthly* first appeared in 1894.

Harvard University granted nine doctorates in mathematics

in the last quarter of the nineteenth century; Johns Hopkins, 32; Yale, 18; Columbia, eight; Clark, 12; and the University of Chicago, 11.

In Indiana, so far as can be learned, the first non-honorary master's degree was given at Indiana University to Joseph Swain in 1885, and the second, in 1888, to Francis Preserved Leavenworth, who later became a prominent astronomer at the University of Minnesota. Indiana's first earned doctorate in mathematics was a doctor of science degree given in 1893 at Purdue to James Byrnie Shaw, who became one of the leading mathematicians in the country as a professor of mathematics at the University of Illinois. No other doctorates in mathematics were given in Indiana until after the coming of Robert D. Carmichael to Indiana University in 1910. Carmichael remained at Indiana five years, until he went to the University of Illinois, and during that period directed the work for the first two Ph.D. degrees in mathematics given in the state: to Cora B. Hennel in 1912 and to Thomas Edward Mason in 1914. Miss Hennel became an outstanding teacher at Indiana University and Mason attained a similar reputation at Purdue. Indiana University conferred no other doctorates in mathematics for a decade, until several were directed by Kenneth P. Williams and Harold T. Davis. Davis left Indiana in 1937 to become head of mathematics at Northwestern University.

Beginning in 1924 with the complete reorganization of graduate study, Purdue has been offering work leading to the doctorate, as has Notre Dame. Following World War I, American universities brought from Europe mathematicians of international reputation who have done much to develop research and direct graduate work in American universities. Purdue has had Wilhelm Maier, Cornelius Lanczos, and Arthur Rosenthal; Indiana University, H. F. Bohnenblust, Samuel Eilenberg, and Emil Artin; and Notre Dame, Karl Menger. Almost all of these men have now gone to universities in other states. The departments at both Indiana University and Purdue have been greatly strengthened recently, and the granting of doctorates is a definite policy. Several Indiana colleges also give graduate mathematics leading to the master's degree.

In 1900, mathematicians who had resided in the state and had published research of considerable merit were very few,

the best known being Kirkwood, Eddy, Hathaway, Shaw, Aley, and Rothrock. Of a total membership of 337 in the American Mathematical Society, Indiana could claim only eleven as residents. In 1948 Indiana had 79 members in the Society out of a total membership of 3,805. The Mathematical Association of America was founded in 1916, and the Indiana Section organized in 1925. This Section meets at least annually and is affiliated with the Mathematics Section of the Indiana Academy of Science. In 1949, Indiana had 103 members in the Association out of a total membership of 3,748.

At the present time considerable mathematical research is being done in the state, papers are being published in American and foreign research magazines, and Indiana's future in mathematics appears bright. It is not the purpose of this brief history, however, to discuss living personalities or to evaluate research activities. It is the hope of the author to present in the future many of the interesting details here omitted.

## ASTRONOMY IN INDIANA

*With the aid of F. K. Edmondson, Indiana University*

Indiana's large amount of cloudiness and its humid atmosphere, and the turbulence of the air associated with the low altitude and humid climate, limit astronomical studies. However, Indiana is the birthplace of five astronomers who have been starred in *American Men of Science* as especially distinguished in research: C. L. Doolittle, J. C. Duncan, J. A. Miller, E. C. Slipher, and V. M. Slipher. Indiana was also the scene of the college education of all these men but one, Doolittle. Three other starred astronomers graduated from Indiana schools of higher learning: J. A. Anderson, C. O. Lampland, and J. A. Parkhurst.

Although some astronomy was taught even a century ago at Wabash, DePauw, and Notre Dame, Indiana University has been pre-eminent in this field. Daniel Kirkwood, one of the country's chief astronomers in his time, was professor at Indiana University 1856-86. John A. Miller was professor 1896-1906, during which period four subsequently-starred astronomers were graduated.

Most of the colleges and universities of Indiana now teach at least an elementary course in astronomy, and there are observatories at DePauw, Earlham, and Hanover, as well as at Indiana. Butler University has the only Spitz planetarium in the state. However, Indiana is the only school in the state that offers considerable training. Recently it has had a staff of four professors and has been offering work leading to the doctorate.

The difficult climatic conditions in Indiana for the study of astronomy for many years discouraged development of facilities for detailed observations. However, the Goethe Link Observatory, built in 1937 by an Indianapolis man and given to Indiana University in 1947, now supplies relatively excellent facilities for several sorts of studies. Moreover, the climatic handicaps are partly offset by excellent opportunities now present to use more favorably situated observatories in other states. Hence, the future appears bright for those few persons who have the interests and the qualifications to become astronomers.

## BOTANY AND BOTANISTS IN INDIANA

Of the scientists sketched in this volume, 168 characterize themselves as botanists. Fully 350 more are primarily botanists: seven are plant ecologists; 19, foresters; 37, horticulturists; 14, mycologists; 52, plant pathologists; 71, pharmacologists; 32, plant physiologists; and a considerable number of the 26 geneticists and the 79 biologists work with plants, as do all of the 95 bacteriologists.

A recent poll of members of the Indiana Academy of Science revealed that more are especially interested in the botany section than in any other. Of those who had been president of the Academy, 15 were botanists and three were bacteriologists.

Indiana has held an exceptionally high rank in botany for many years. John Merle Coulter, one of the leading botanists of his generation, taught at Hanover College 1874-79, and with Charles R. Barnes started the *Botanical Gazette*, for decades perhaps the leading botanical journal of the United States. During the years that Dr. Coulter was at Wabash College (1880-91), that institution was a leader, both as a botanical research center and in graduating men sub-

sequently distinguished in botany. His successor there, Mason B. Thomas, also was able to attract and train men who later became distinguished. (For the list, see "Wabash College and Science.")

Purdue University for many years had the services of Stanley Coulter, brother of J. M., and of J. C. Arthur. These men did much to increase the appreciation of botany in Indiana. Dr. Coulter was highly influential in forest preservation and improvement, and Dr. Arthur was a world-renowned investigator of plant rusts. Purdue has also employed and trained many excellent horticulturists, plant pathologists, pharmacists, and bacteriologists.

Indiana University has had a strong department of botany for many decades, commencing during the presidency of David Starr Jordan. Professors Mottier, Andrews, and Weatherwax have been presidents of the Academy. Professor Weatherwax's prolonged studies of corn are widely respected, and Professor Cleland is world-renowned for his work in plant genetics.

DePauw University has had a succession of able men in botany: professors, and students later distinguished. Two professors have recently been presidents of the Academy. Of the persons who obtained Ph.D. degrees in botany in the United States 1936-45, 11 had obtained their college degrees from DePauw, nine from Butler, seven from Purdue, six from Indiana University, two from Notre Dame and Wabash, and one each from Hanover, Indiana State, and Manchester. In that decade, Indiana University granted nine doctorates, Purdue, five, and Notre Dame, three.

Butler University has had a strong department of botany since 1919, when R. C. Friesner joined the faculty. During recent decades many of the abler students have been attracted to botany, and a long list of alumni have become well-known botanists. (For the list see "Butler University's Contribution to Science.") A large amount of good botanical research has also been done at Butler by both faculty and advanced students.

Botany has been taught at all Indiana colleges for many decades. Partly as a result, there is widespread interest among citizens of the state in various aspects of plant studies. The knowledge of the flora of Indiana, that is, the name, number and distribution of the many species found in the

state, is said to be greater than for any other state. This leadership had its roots in the pioneer studies of John M. and Stanley Coulter in the years 1874-1900. It reflects also the work of many later students widely scattered over the state. However, by common consent, chief credit for Indiana's enviable position today goes to Dr. C. C. Deam, in 1900 a business man with a hobby of collecting species of Indiana flora but later state forester, state botanist, and, after reaching 70, state research botanist. His *Flora of Indiana* (1940) is recognized as a classic.

Four aspects of botany especially studied in Indiana are (1) floristics, the description of species and their distribution; (2) ecology, the environmental relations of the plants; (3) the genetic evolution of the plants; and (4) the inter-relations of plants, including pathology.

Natives of Indiana who have been starred in *American Men of Science* for research in botany are C. R. Barnes, H. L. Bolley, O. W. Caldwell, H. M. Fitzpatrick, R. B. Harvey, D. T. MacDougal, G. T. Moore, D. M. Mottier, E. W. Olive, J. N. Rose, J. R. Schramm, and H. H. Whetzel.

In addition to most of the foregoing native Hoosiers, Indiana graduated from its colleges starred botanists W. L. Bray, J. M. Coulter, Stanley Coulter, C. D. LaRue, L. D. Petry, and D. Reddick. Thus, Wabash College has six starred alumni (Moore, Olive, Reddick, Rose, Schramm, and Whetzel); Hanover College has three (Barnes and the Coulter brothers); and Indiana University has two (Bray and Mottier). Indiana colleges with one such alumnus are DePauw (MacDougal), Earlham (Petry), Franklin (Caldwell), Purdue (Bolley), and Valparaiso (LaRue).

Indiana college faculty members, past and present, sometime-starred in botany are: *DePauw*, M. T. Cook, L. M. Underwood; *Hanover*, J. M. Coulter; *Indiana U.*, D. H. Campbell, R. E. Cleland, D. M. Mottier; *Purdue*, J. C. Arthur, Barnes, Bolley, S. Coulter, M. E. Gardner, H. S. Jackson, J. S. Karling, F. D. Kern, MacDougal, E. B. Mains, C. R. Orton, Petry; and *Wabash*, J. M. Coulter, Rose, Thomas.

Indiana's high rank among the states with respect to botany and botanists reflects at least three conditions: (1) The state, though small and rather uniform in many respects, is so located that it includes parts of five contrasting types of

flora. It has been characterized as a transition area. Partly because of its glacial history, several remnants of flora now characteristic elsewhere remain as relicts in Indiana. (2) Indiana was extensively peopled at a time in the history of our country when the flora were first beginning to be studied. It was on the frontier botanically for a significant period, the site of important discoveries and the home of several leaders in botanical research. For example, the first major American study of sequence plant ecology (on progressive changes in the flora), was of the sand dunes of northern Indiana. (3) The outstanding leadership of John Merle Coulter 1874-93 and of some of his students merits special mention. It is probable that Indiana's high rank in the yield of distinguished botanists is due to a considerable degree to this influence. (Although the Coulters were born in China, their parents came from Indiana and their grandfather was the founder of Hanover College.) David Starr Jordan's influence on botany's advancement in Indiana was appreciable, partly because of his own interest in plants but chiefly because of his effective encouragement of research and of talented men. He notably stimulated Dr. Coulter and selected him as his successor as president of Indiana University. In recent decades, the stimulating influences of C. C. Deam, state botanist, and of Ray C. Friesner at Butler and T. G. Yuncker at DePauw, with the aid of their staff members, have been significant.

## THE STUDY OF THE INDIANA VASCULAR FLORA

*By Ray C. Friesner, Butler University*

The earliest scientific work on Indiana plants was done by travelling naturalists, including Andre Michaux (1795), Henrico M'Murtrie (1819), David Thomas (1819), Constantine Rafinesque (1820), John L. Riddell (1836), Prince Alexander Philip Maximilian (1839), and Alphonso Wood (1847).

Work on the vascular flora by Indiana residents began with the collections and studies of a physician, Dr. Asahel Clapp of New Albany, in 1852. Such work by vocational botanists was started by A. H. Young with the preparation of his manual of the botany of Jefferson County, published in 1871. Shortly thereafter, John M. Coulter, who taught at Hanover

College from 1874-79, commenced systematic studies. In 1878, Charles R. Barnes and John F. Baird published catalogs of the vascular plants of Jefferson and Clark counties.

The first comprehensive list of vascular plants of Indiana was compiled in 1881 by John M. Coulter, Charles R. Barnes, and Stanley Coulter. Numerous local and county lists appeared in succeeding years. Stanley Coulter published in 1900 a comprehensive catalog of the flowering plants and ferns and fern allies indigenous to Indiana, a compilation of all previous published lists.

About 1900 a young druggist of Bluffton, Charles C. Deam, began botanical work which took him into every township in the state and resulted in a private collection of more than 60,000 specimens. His studies have led him to publish *Trees of Indiana* (four editions, with a fifth in progress), *Shrubs of Indiana* (two editions), and *Grasses of Indiana*, and have culminated in a masterpiece of local flora literature, *Flora of Indiana* (1940; 1236 pp.). Largely because of Dr. Deam's efforts, Indiana became first in the nation in knowledge of its state flora.

Following the publication of *Flora of Indiana*, numerous workers have collaborated with Dr. Deam in preparing annual reports. Mentioned by him as especially helpful are A. R. Bechtel, R. C. Friesner, R. M. Kriebel, J. E. Potzger, Paul Weatherwax, Winona Welch, and T. G. Yuncker. Between 1940 and 1950 nearly 8,000 new county records and 125 new state records were added. (Dr. Yuncker is also outstanding among Indiana monographers for his work on the *Dodders*, genus *Cuscuta*.)

## ZOOLOGY AND ZOOLOGISTS IN INDIANA

Of the scientists sketched in this volume, 142 list themselves as zoologists and 85 as biologists, while many others who study animals list themselves as specialists. For example, 57 are entomologists, seven are animal ecologists, nine are embryologists, three are animal pathologists, and four are ornithologists. In addition, a considerable number of the eight cytologists, 26 geneticists, 15 histologists, and six anatomists study animals. Another sizable group actually study animals: 27 animal husbandry men, 26 dairy experts, 13 poultry experts, and ten veterinarians. Thus, it appears that

about 400 scientists here sketched are students of animals.

Indiana has ranked high as to zoologists since the 1870's. Before that date, little zoological work had been done in the state, although some naturalists traveling along the Ohio River or staying briefly at New Harmony or elsewhere had made collections, had described some new species of animals, and had compiled fragmentary lists of the local fauna.

The coming of David Starr Jordan to the state in 1874 soon resulted in greatly increased interest in the fauna. He was such an enthusiast, so adept at recognizing talent, and so successful in encouraging others that even his year as a teacher in the Indianapolis high school had significant results. Two of his high school students became distinguished zoologists. During his years at Butler (1875-79), his stimulating influence was notable. His years at Indiana University (1879-85 as professor, 1885-91 as president) resulted in that University's becoming widely known as a center of zoological research and training. Dr. Jordan's extensive writings and his scattered students helped spread his influence. Indiana was the state of birth of 19 men who have been starred as zoologists in *American Men of Science*. Thirteen of these men were students of Dr. Jordan or of men started by him. In addition to these 19 native Hoosiers, several subsequently-starred zoologists came into Indiana to study under Dr. Jordan or his students.

Zoology has been taught in all Indiana colleges since 1890. Of the 19 subsequently-starred zoologists, two got their college degrees at Butler, three at DePauw, two at Earlham, and 12 at Indiana University. In addition, five of those who received earned higher degrees at Indiana under Dr. Jordan were subsequently starred.

Of the faculty, past or present, who have been starred in zoology, Indiana University has had 13. They are listed in the summary as to zoology at Indiana University. Butler has had three (while Jordan was there), and DePauw, Earlham, and Purdue, one each. Hence, in this respect also Indiana University's position in zoology is outstanding. Of the present Indiana University zoology faculty, four are starred and two are members of the National Academy of Sciences, Muller and Sonneborn. Muller is a Nobel prize winner.

During 1936-45, Indiana University awarded 13 doctorates in zoology, Purdue, four, and no other Indiana institution

any. In those years, Indiana University ranked sixteenth among American universities in the number of doctorates conferred in zoology.

Of the 955 persons who received the doctorate in zoology 1936-45 in the United States, 34 had received their college degree in Indiana: DePauw had graduated 12; Purdue, six; Butler, Earlham and Wabash, three each; Indiana University, Indiana Central, and Notre Dame, two each; and Goshen, one.

Of the presidents of the Indiana Academy of Science, 13 are known as zoologists, five as entomologists, and one as a biologist. Of these 19 men, Indiana University employed five, Purdue, two, Butler, two, and Earlham, Indiana Central, Indiana State Teachers, Moores Hill, and Wabash, one each; the state government employed three, and two were privately employed. (The names of these ex-presidents are listed elsewhere.)

The preceding two paragraphs reveal that zoology has been well represented and taught at several Indiana schools. Purdue stands high, especially as to entomology. Butler, DePauw, Notre Dame, and Wabash have had a succession of able teachers. The summaries as to those institutions give some details and names.

Zoology is such a large field that few workers attempt to study all aspects. The study of fishes was an especial interest of Jordan, Gilbert, Eigenmann and Ricker, while insects especially interested Blatchley, Bodine, Davis, Kinsey, Wallace, and Williamson. Bird study had a special appeal to Butler, S. Coulter, M. L. Fisher, McAtee, Scott, and Test.

## GEOLOGISTS AND GEOLOGY IN INDIANA

Of the scientists sketched in this volume, 88 are geologists and 13 are paleontologists. Six native Hoosiers have been starred in *American Men of Science*: H. F. Bain, C. P. Berkey, O. P. Hay, E. M. Kindle, P. B. King, and F. B. Taylor. Only one of these six graduated from an Indiana college, Kindle, from Indiana University; but two additional geologists received graduate degrees at Indiana University, J. C. Branner and Hay. Three subsequently-starred geologists have taught in the state, Hay at Butler and Branner and Kindle at Indiana University, but Kindle for only one year.

Geology has been taught at Indiana University since the Civil War and at DePauw, Earlham, Hanover, Indiana State, Notre Dame, and Wabash for long periods. During his years at Indiana University, David Starr Jordan taught a popular course in geology. Similarly, at Wabash College, John Merle Coulter taught geology as well as biology.

Graduate work in geology has been offered only at Indiana University, where during 1936-45 three doctorates were awarded. Of 420 persons who received the doctorate in geology in American universities in that decade, 12 had received their undergraduate degree from an Indiana college or university: five from Indiana University, five from DePauw, and one each from Earlham and Hanover.

Field geologic studies commenced early in Indiana. The summary below on geologists before 1900 by the late C. A. Malott reports on them. From 1918-46 Dr. Malott himself did much field work in the state. Other geologists meriting mention in the period 1900-50 include C. R. Dryer, professor at the State Normal 1893-1913; W. N. Logan, professor at Indiana University and state geologist 1919-35, and editor and co-author of *Handbook of Indiana Geology* (1922); E. R. Cumings, head of the department at Indiana University 1902-42; Charles F. Deiss, state geologist and chairman of the department of geology at Indiana University since 1945; and Ernest R. Smith, head at DePauw 1921-47, an exceptionally stimulating teacher of able students.

Of the presidents of the Indiana Academy of Science, J. C. Branner, G. Culbertson, E. R. Cumings, C. R. Dryer, and C. A. Malott were geologists. O. P. Hay was a paleontologist, although when elected he was chiefly a zoologist. Dryer was a geographer as well as a geologist.

Of the geologists from Indiana, Berkey and Branner became most famous, both president of the Geological Society of America and both a member of the National Academy of Sciences. Berkey is especially noted for his aid to engineering. A Berkey volume of the Geological Society of America issued in 1950 contains an evaluation of his accomplishments. Branner succeeded David Starr Jordan as president of Stanford University.

*Indiana Geologists Before 1900*

By Clyde A. Malott, Indiana University

The geology of Indiana has been the subject of study by a few geologists whose names are famous in American geology, but the presentation of the field details has been largely the work of local geologists. This is true not only up to 1900, but to the present. J. P. Leslie and F. H. Bradley worked briefly in Indiana in 1859 and 1869, respectively. Leo Lesquereux, S. A. Miller, C. A. White, E. D. Cope, and James Hall contributed notably to the paleontology of Indiana in the 1870's and 1880's. Lesquereux was on the second Owen survey in 1859 and contributed notably to the knowledge of the coal-bearing formations. Frank Leverett, T. C. Hopkins, and G. H. Ashley presented much field detail in Indiana geology in the 1890's.

All of the official state geologists of Indiana have been residents, and their reports constitute voluminous details on Indiana geology. D. D. Owen of New Harmony made a special geological survey of Indiana in 1837-38. A second special survey was made by R. T. Brown, 1851-53, and a third by Richard Owen, 1859-61. E. T. Cox, also of New Harmony, was state geologist for ten years following the establishment of the Indiana Geological Survey in 1869. For the detailed county surveys of the Cox period, Rufus Haymond, John Collett, B. C. Hobbs, Robert Warder, W. W. Borden, M. N. Elrod, and E. S. McIntire did much of the field work. John Collett followed as state geologist and served until 1885. He employed the services of G. K. Greene, R. T. Brown, A. J. Phinney, D. S. M'Caslin, and M. N. Elrod. Maurice Thompson was appointed state geologist in 1885 and served until 1888. His geologist staff was composed of S. S. Gorby, A. J. Phinney, W. H. Thompson, R. T. Brown, and C. R. Dryer. S. S. Gorby was appointed state geologist in 1889 and served until 1894. He was aided by Maurice Thompson, M. N. Elrod, A. C. Benedict, E. P. Cubberly, and C. R. Dryer. The productive surveys and investigations of W. S. Blatchley began in 1895 and continued for 16 years. His earlier staff was composed of C. E. Siebenthal, E. M. Kindle, J. T. Scovel, and J. A. Price, all local geologists, and in addition, he had the services of specialists T. C. Hopkins and G. H. Ashley.

Other geologists contributing to the geology of Indiana be-

fore 1900 were C. S. Beechler, V. F. Marsters, John Newsom, Joseph Moore, L. F. Bennett, A. C. Veatch, A. H. Purdue, W. A. McBeth, and Glenn Culbertson. (Of the 44 geologists herein mentioned, 34 were residents or natives of Indiana.)

## INDIANA GEOGRAPHERS

*By J. E. Switzer, Indiana University*

Geography as a subject of college grade is of recent development in the United States, though it has long held an important place in European universities.

Charles R. Dryer, during his twenty years of teaching at the State Normal School at Terre Haute, helped many future Indiana teachers to realize that geography is much more than the memorization of facts and places. He inspired his pupils to investigate their surroundings, and taught them to observe both the development of phenomena and the human relationships to these phenomena. Dr. Dryer also furthered geographic concepts by writing *Studies in Indiana Geography*, *Lessons in Physical Geography*, and *Geography—Physical-Economic-Regional*. He was a charter member of the Indiana Academy of Science and its president in 1911. Geographers who followed Dr. Dryer at Terre Haute are Bernard H. Schockel (who made a pioneer study of the geography of the manufacturing industries of Evansville), Frederick J. Breeze, Leroy Perkins, and G. David Koch.

At Ball State Teachers College, geography is a division of the department of science. Dr. Floy Hurlbut succeeded F. J. Breeze in 1931 as head instructor, and she and her assistants offer a wide choice of courses.

Alfred H. Meyer of Valparaiso University has built up a large and enthusiastic clientele among his students. His interests are largely in the human and economic phases of geography.

At Indiana University, geography was taught in the department of geology until 1946, when it was awarded departmental status. In 1950, the department of geography had a staff of nine. A dozen masters' degrees had been awarded, and the first doctorates. Stephen S. Visher was Indiana University's first trained geographer. His numerous publications, stressing comparisons and contrasts in the climate and in all

phases of production within the state, have increased awareness of geographical contrasts. Others who have taught geography at Indiana University include J. E. Switzer, especially interested in the development of inland transportation; Chauncy D. Harris, interested in urban geography; Otis W. Freeman, author of papers on various aspects of Indiana geography, notably the state parks; Otis P. Starkey, chairman of the department and co-author of a widely-used text book on economic geography; Thomas F. Barton, devoting his efforts especially to the development of better teaching methods and techniques; and George J. Miller, for thirty years editor of the *Journal of Geography*. (Upon Dr. Miller's retirement, Dr. Barton became editor of the *Journal*.) Four former members of the department of geology and geography who contributed to increased understanding of various aspects of Indiana's geography are William M. Tucker, who studied Indiana lakes and water power; Arch R. Addington, who made a model of the Bloomington Quadrangle which gave impetus to local field studies; William D. Thornbury, who studied the glaciation boundary, glacial soils, mineral waters, and health resort distribution; and James R. Anderson, whose five published studies of the geography of Morgan County have made it one of the better-known counties of the state geographically.

Among the alumni of Indiana University who have won recognition as geographers are Clifford M. Zierer, long chairman of the department at the University of California at Los Angeles; John K. Rose, geographer consultant to the U. S. Congress; Richard Houk, professor, De Paul University; James R. Anderson, professor, University of Maryland; Suprakos Ghosh, expert with the Food and Agricultural Organization of the United Nations; Benjamin Moulton, professor and head of the department at Butler University; and Ronald L. Ives, author of numerous scholarly papers.

Some geography is taught at most of the other universities and colleges of Indiana but mostly by men who are not trained geographers. Little systematic geographic research has been carried on in Indiana, and many opportunities await willing, competent investigators.

## CONTRIBUTIONS TO CONSERVATION IN INDIANA

*By Howard H. Michaud, Purdue University*

Conservation of Indiana's natural resources requires an understanding of what resources there are and how they should be managed to yield the greatest benefit to the people. All who have furthered this knowledge should be commended. Space does not permit detailing even a part of the outstanding work that has been done by many.

The work of most early scientists of Indiana was primarily taxonomic. Thus, man's first contact with the flora, fauna, geology, mineralogy, and soils of Indiana was for the purpose of describing and naming them. The spirit of exploring prevailed among the well-known members of the New Harmony community from 1815-1875, including Robert Owen and Dale Owen, geologists; Thomas Say, "the father of American entomology, conchology and zoology"; and Charles A. Le Sueur, ichthyologist.

Although most recent scientists have been concerned with the utilization and management of resources, the task of recording has continued.

Among those who were prominent before 1900 are Amos W. Butler (ornithologist), David Starr Jordan (ichthyologist), Willis S. Blatchley (naturalist, author, and state geologist), E. B. Williamson (entomologist), and Frank B. Taylor (geologist). Both Blatchley and Butler frequently expressed concern over the undue exploitation of Indiana's natural resources, Mr. Butler as early as 1894 in his presidential address to the Indiana Academy of Science.

The agency of state government most active in the study and conservation of natural resources from 1869 to 1919 was the office of the state geologist. While most of its attention was directed toward developing Indiana's rocks, minerals, oil, and gas, there were many studies of native flora and fauna.

During the early years of the present century, numerous prominent individuals clearly understood that Indiana's resources were dwindling rapidly. Stanley Coulter, botanist and dean of the school of science, Purdue University, was well aware by 1900 of diminishing forest resources, and frequently expressed concern. Under his direction Professor B. N. Prentice, graduate of the New York State College of Forestry,

came to Purdue University in 1914 to conduct courses in forestry. In 1926, forestry received full department status with Professor Prentice as head. Dean Coulter was an original member of the Conservation Commission established in 1919. Frederick J. Breeze, Ball State Teachers College, advocated setting aside an area of natural beauty as a state park as early as 1906. Impressed by the ruinous effects of deforestation in the hills of southern Indiana, Glenn Culbertson, Hanover College, in a presidential address to the Academy in 1908, advocated reforestation.

In 1913, a conservation symposium was held at the annual meeting of the Indiana Academy of Science. This brought together leaders in conservation and reported the status of natural resources. Jay Cravens told of a sanitary survey of Indiana rivers; Will Scott, Indiana University, discussed the relation of the lakes of northern Indiana to flood control; H. W. Anderson, botanist, Wabash College, spoke on taxation of forest lands; Stanley Coulter spoke on first steps in Indiana forestry; and F. M. Andrews, botanist, Indiana University, discussed forests and floods. Mineral resources were included in the symposium. Edward Barrett, state geologist, discussed possible dangers from drilling for oil and gas, and G. C. Mance, Bloomington, spoke on power economy and utilization of waste in the quarry industry. Public health as related to human conservation was also discussed.

An important step was the establishment of the Indiana Department of Conservation in 1919. Conservation leaders for some time had urged that all of the natural resources come under a co-ordinated plan of administration. Colonel Richard Lieber, Indianapolis, ardent conservationist with particular interest in forests, was appointed director. His capable influence directed the selection of W. A. Guthrie, Dupont, and John W. Holtzman, Indianapolis, two men prominent in business and politics, as members of the first commission. Dean Stanley Coulter of Purdue and Richard M. Holman of Wabash, both prominent botanists, were appointed as the two other members.

Division directors of the first Department of Conservation were W. N. Logan, state geologist, Frank N. Wallace, state entomologist, Charles C. Deam, state forester, and Richard Lieber, director of state parks. Colonel Lieber was influential in developing Indiana's state park system into one of

the most outstanding in the nation. He also wrote *America's Natural Wealth*, published by Harper's (1942). Frank N. Wallace long continued as director of the division of entomology, and his influence in promoting conservation of the resources of the state has been notable.

Indiana owes great respect, praise, and tribute to Charles C. Deam, first state forester, for his numerous contributions to conservation. For many years he has studied forestry and the flora of the state. Dr. Deam began managing the Clark County State Forest shortly after its start in 1903, and continued to serve as state forester until 1929. *Flora of Indiana* (1940) is a monumental contribution. Other works include *Trees of Indiana*, *Shrubs of Indiana*, and *Grasses of Indiana*.

David Starr Jordan, while professor at Indiana University, in 1880 initiated the study of Indiana's fisheries resources. Research and fisheries management have been continued by Indiana University in co-operation with the Indiana Department of Conservation. National recognition in this field has been maintained through the successive leaderships of C. H. Eigenmann, Will Scott, and William Ricker.

Persons who contributed much to the conservation of bird life and to the early work of the Indiana Audubon Society include Stanley Coulter, Amos W. Butler, Willis C. Blatchley, David W. Dennis, M. L. Fisher, L. A. Test, William Watson Woolen, Robert McBride, Rousseau McClellan, S. E. Perkins III, Frederick Breeze, and Frank C. Evans. Two persons still active and meriting commendation for their many years of service are Alden Hadley of the Indiana Department of Conservation, and Earl Brooks, director of the Mary Gray Bird Sanctuary, Connersville.

Some scattered efforts on soil conservation shortly after the Civil War were reported in annual reports of the Indiana Department of Geology and Natural Resources. It was nearly 1920 before any notable contribution was made to soil conservation. T. M. Bushnell of Purdue began his soil surveys in that year, studies which he continues and which have contributed generously to the knowledge of Indiana soil types throughout the years.

One of the state's most ardent exponents of soil conservation was Ralph M. Kriebel (1897-1946). In 1935 he became biologist and farm planner for the Soil Conservation Service, and from 1943 to 1946 served as extension soil conservation-

ist, Purdue University. There he became nationally known.

Frank B. Wynn, a physician of broad influence not only in Indiana but in the nation, was an effective champion of conservation, state parks and outdoor life.

A list of leaders still active in the conservation of our Indiana resources follows:

#### *Forestry*

E. R. Martell, T. E. Shaw, Daniel Den Uyl, B. N. Prentice,  
Department of Forestry, Purdue University

Charles C. Deam, botanist, Bluffton

Ralph Wilcox, State Forester, Indiana Department of Conservation

John E. Potzger and Ray C. Friesner, Department of Botany, Butler University

#### *Soils*

George Scarseth, Director of Research, Indiana Farm Bureau, Lafayette

Kenneth M. Welton, State Soil Conservationist, U. S. Soil Conservation Service, Lafayette

T. M. Bushnell and J. B. Peterson, Department of Agronomy, Purdue University

#### *Geography and Geology*

S. S. Visser, Department of Geography, Indiana University

C. F. Deiss, State Geologist, and R. E. Esarey, Department of Geology, both at Indiana University

Alfred H. Meyer, Valparaiso University

#### *Fisheries*

Dave G. Frey, Shelby Gerking, and W. E. Ricker, Department of Zoology, Indiana University

#### *Entomology*

Frank N. Wallace, Director, Division of Entomology, Indiana Department of Conservation

J. J. Davis, Head, Department of Entomology, Purdue University

#### *Wildlife*

William B. Barnes, Coordinator, Pittman-Robertson Wildlife Projects, Indiana Department of Conservation

C. M. Kirkpatrick, Department of Forestry, Purdue University

*Water*

Charles M. Beckert, Director, Division of Water Resources,  
Indiana Department of Conservation

*Conservation Education*

Howard H. Michaud, Department of Forestry, Purdue University

## CHEMISTRY AND CHEMISTS IN INDIANA

Chemists comprise slightly more than a fourth of the scientists sketched in this volume. They are more numerous than any other group.

Chemistry is now taught at each of the colleges, and most of them have had relatively strong departments for many decades. Sketches as to the local situations are given elsewhere for several of the institutions. Purdue University has already conferred more than 3,000 masters' degrees in chemistry and 704 doctorates. During the decade 1936-45 Purdue awarded 173 doctorates in chemistry and biochemistry, Indiana University 70, and Notre Dame 61. The number of persons who obtained doctorates in chemistry, biochemistry, pharmacology and allied subjects during 1936-45 who had received their collegiate training in Indiana is as follows: Indiana University, 62; Purdue, 55; DePauw, 46; Notre Dame, 44; Wabash, 18; Manchester, 14, Butler, seven; Evansville, seven; Hanover, five; Rose Polytechnic, five; Franklin, three; Indiana State College, three; Tri-State, two; and Ball, Goshen, Oakland City, and Valparaiso, each one.

Eleven chemists starred in *American Men of Science* were born in Indiana: R. F. Bacon, G. L. Clark, A. C. Cope, M. R. Fenske, C. A. Kraus, S. A. Lattimore, H. M. McCoy, W. A. Noyes, Lee J. Smith, W. M. Stanley, and H. W. Wiley. Of these Cope, Kraus, Noyes, Smith, and Stanley have been elected to the National Academy of Sciences, and Stanley has won a Nobel prize. Another Nobel prize winner born in Indiana, H. C. Urey, is a physical chemist.

Thirteen chemists who have been starred obtained their college training in Indiana: *Butler*, Cope; *DePauw*, Bacon, Clark, Fenske, Lattimore; *Earlham*, H. E. Howe, Stanley, R. B. Warder; *Hanover*, Wiley; *Manchester*, P. J. Flory; *Notre*

*Dame*, J. A. Nieuwland; *Purdue*, McCoy; and *Valparaiso*, J. E. Teeple.

The record as to DePauw merits special mention. W. M. Blanchard's success in encouraging able students to become scholars is in conspicuous contrast to the failure to have a single chemistry alumnus of Indiana University to win a star, and none from Purdue since 1892. Purdue has had since 1892 many thousands of graduates in chemistry.

Of the present or former faculty members, the following have been starred in chemistry: *DePauw*, Lattimore; *Earlham*, H. N. Holmes; *Indiana University*, F. T. Gucker, R. E. Shriner; *Notre Dame*, J. A. Nieuwland; *Purdue*, H. B. Hass, Walter Jones, H. W. Wiley; *Rose*, W. A. Noyes (the father); and *Wabash*, Alexander Smith.

The following chemists have been president of the Indiana Academy of Science: Wm. Blanchard, E. F. Degering, P. N. Evans, E. G. Mahin, M. G. Mellon, G. A. Nieuwland, W. A. Noyes, F. B. Wade, and H. W. Wiley.

## ENGINEERS IN AND OF INDIANA

About 500 engineers are sketched in this volume because they are recognized as scientists as well as engineers. A considerable proportion of them have been connected with engineering schools or with experiment stations, largely in other states. However, Purdue University, for decades one of the largest American engineering schools, has employed many scientists engineers and has trained a sizable number. Notre Dame University, Rose Polytechnic Institute, and Valparaiso University have also had schools of engineering that have employed or trained a number here sketched. Purdue University conferred 16 doctorates in engineering 1936-45. Of the 545 persons who received doctorates in engineering from American universities in that decade, 13 had received their college degree in Indiana, eleven from Purdue and one each from Rose Polytechnic and Goshen.

Indiana engineers have included some of the most eminent, for example, James B. Eads and Ellwood Mead, both world renowned. (For something as to their work, see their sketches.) A. A. Potter, dean at Purdue, has received high recognition for distinguished work in "human engineering"—learning what each young engineer is best qualified to do

and helping him get work for which the requirements essential to success are those that he possesses.

## INDIANA SOIL SCIENCE AND SCIENTISTS

*With the aid of T. M. Bushnell, Purdue University*

Soil chemistry and the use of fertilizers were studied extensively commencing in 1880 by members of the staff of the U. S. Experiment Station at Purdue by Professors C. L. Ingersoll, W. C. Latta and S. D. Conner.

Soil experts who carried on soil investigations in Indiana for a number of years and who then continued field studies elsewhere include: J. B. Abbott, H. R. Adams, J. E. Adams, S. C. Jones, A. B. Krantz, N. J. Plice, J. H. Robinson, C. S. Simmons, H. R. Smalley, S. F. Thornton and P. T. Veale.

Those of the present Purdue staff who have been active in Indiana soil studies for a decade or longer include: T. E. Barnes, T. M. Bushnell, H. Kohnke, R. R. Mulvey, A. J. Ohlrogge, H. P. Ulrich, G. P. Walker and R. A. Weaver.

In recent years, the soil studies have been increasingly devoted to fundamental problems such as soil temperatures, drainage, structure, tilth, mulch tillage, muck subsidence, the determination of "available elements", exchangeable ions, evidences of plant food deficiencies, etc. U. S. Jones made in 1940 some pioneer studies with radio-active tracers.

Since 1934 the U. S. Soil Conservation Service has made in Indiana highly significant contributions to increasing the knowledge of soils and their wiser utilization.

Various engineering aspects of soils have been studied by the Joint Highway Research Project under the leadership of K. B. Woods.

The field mapping of soils under the direction of A. D. Hole, Professor of Geology at Earlham, was especially notable in starting several men who later became distinguished soil scientists. Included are Mark Baldwin, Earl D. Fowler, O. C. Rogers and James Thorp. Thorp is widely recognized for his studies of the soils of China.

## AGRICULTURISTS IN AND OF INDIANA

Of the scientists sketched in this volume, nearly 250 may be classed as agriculturists. These men are nearly all pro-

fessional workers connected with universities or experiment stations. They include about 50 agronomists, about 40 horticulturists, about 25 each of animal husbandrymen, dairy experts, and soil scientists, and from ten to 20 experts each in forestry, poultry, and veterinary science. Also, five are listed as pomologists and 33 as agricultural economists.

Purdue University has trained a large share of these scientists who received their training in Indiana, and Purdue and the associated U. S. Experiment Station have employed most of those who found employment in Indiana. However, both Notre Dame and Valparaiso universities had for some years schools of agriculture, and they helped train and employ a few of these men. A number of agriculturists were partly trained, chiefly as undergraduates in botany, at other colleges in the state.

Although many of the workers in agriculture here sketched are natives of Indiana and received much of their training here, more came into Indiana from other states for employment than went out from the state after graduation.

Purdue University awarded seven Ph.D.'s in agriculture during 1936-45, and one in horticulture. Among the nation's leading universities in this respect, Purdue ranked eleventh.

Of the 638 persons who received doctorates in the United States 1936-45 in agriculture or horticulture, 20 received their college degree in Indiana. Purdue graduated 17 and DePauw, Wabash, and Indiana State Teachers College one each.

Purdue University has consistently ranked as one of the nation's strongest agricultural colleges, and with Purdue has been closely associated one of the most productive of the U. S. experiment stations. Research has been conducted on numerous subjects, but perhaps meriting special mention here is that on poultry, including new methods for culling non-layers; on the development of hybrid corn; and on plant diseases. Much attention has also been devoted to nutritional studies of plants, animals, and man.

## PSYCHOLOGY AND PSYCHOLOGISTS IN INDIANA

The second psychological laboratory in the United States was established at Indiana University, and the first detailed study of learning ever made by psychologists was made here

1894-97, the famous Bryan study of the telegraphic language. Partly because of the interest in psychology at Indiana University following 1890, seven native Hoosiers have been starred in psychology in *American Men of Science* as distinguished research workers. Eight such people received their college degrees in the state. This output of psychologists is exceeded in proportion to population by very few states.

Of the eight starred in psychology who graduated in Indiana, Indiana University yielded W. L. Bryan, '84, E. H. Lindley, '93, E. D. Starbuck, '90, C. P. Stone, '15, and L. M. Terman, '02. Earlham College graduated W. R. Miles, '08; Evansville College, J. F. Dashiell, '08; and Valparaiso University, C. P. Stone, '10. The one starred psychologist born in Indiana but graduated elsewhere is G. W. Allport.

Two starred or subsequently-starred psychologists came into Indiana to work, Lillian Martin to Shortridge High School and B. F. Skinner to Indiana University. Dr. Skinner was elected to the National Academy of Sciences after leaving Indiana University. Lewis M. Terman, a teacher in Indiana for several years, is also a member of the National Academy of Sciences following his development of improved aptitude tests and prolonged studies of exceptionally brilliant people.

The Indiana University psychology faculty has included a succession of men, notably, W. L. Bryan, E. H. Lindley, J. A. Bergstrom, W. F. Book, J. R. Kantor, G. S. Snoddy, E. S. Conklin, B. F. Skinner, R. C. Davis, and D. G. Ellson.

A total of 210 psychologists are sketched in the present volume. Of these, more than half are natives of Indiana, many of whom left the state for their college and graduate training.

Psychology has long been taught at all colleges and universities in Indiana. Graduate degrees are given in psychology at the larger universities, and numerous doctorates have recently been conferred at Indiana University and Purdue—during the decade 1936-45, ten at Indiana University and 22 at Purdue (one at Notre Dame).

Purdue has specialized in industrial and applied psychology, and the department at Indiana University has specialized in experimental and theoretical psychology. Both departments have maintained training and research programs in clinical psychology.

Of the 958 persons who received doctorates in psychology somewhere in the years 1936-45, 25 had received their college degree from an Indiana school: seven each from DePauw and Indiana University, six from Purdue, and one each from Butler, Canterbury, Notre Dame, St. Joseph's, and Valparaiso.

## PHYSICS AND PHYSICISTS IN INDIANA

About 460 of the scientists sketched in this volume class themselves as physicists, and a considerable number of the engineers apply physics. The yield of physicists per 100,000 population is, however, somewhat less in Indiana than in the average state. This is in contrast to a higher than average yield of biologists and psychologists.

Physics has been taught in Indiana colleges for many decades. (Some details as to Butler, DePauw, Indiana, Notre Dame, Purdue, and Rose Polytechnic are given in the summaries for those institutions.) Indiana University and Purdue have had especially strong departments in recent decades, but even before 1890, Rose Polytechnic had on its staff several outstanding physicists.

Seven natives of Indiana have been starred in *American Men of Science* for research in physics: L. A. DuBridge, A. L. Foley, W. H. Furry, E. Merritt, W. B. Nottingham, J. O. Reed, and H. C. Urey. Urey also won a Nobel Prize and he and DuBridge are members of the National Academy of Sciences. Only three of these seven starred physicists graduated from Indiana colleges, but eight subsequently-starred men came into Indiana for their college training; namely, F. C. Brown, E. S. Johonnott, C. T. Knipp, A. C. Longden, M. Luckiesh, C. E. Mendenhall, G. W. Stewart, and O. M. Stewart. *DePauw* graduated four (Furry, Longden, and the Stewart brothers); *Indiana University* graduated three (Brown, Foley, Knipp); *Purdue* graduated Luckiesh and Nottingham; and *Rose* graduated Johonnott and Mendenhall. Past or present members of the faculty of Indiana schools who have been starred are: *Purdue*, A. P. Carman, A. W. Duff, E. S. Ferry, K. Lark-Horovitz, L. M. Norheim, F. A. Waterman; *Indiana*, F. C. Brown, A. L. Foley, C. T. Knipp, A. C. G. Mitchell, B. F. Snow; *Rose*, Johonnott, Mendenhall; and *Wabash*, N. A. Kent.

Seven past presidents of the Indiana Academy of Science

were physicists, T. C. Mendenhall, Thomas Gray, A. L. Foley, C. L. Mees, L. P. Naylor, R. R. Ramsey, and J. F. Mackell.

During 1936-45, Purdue conferred the Ph.D. in physics on 29, Indiana on 21, and Notre Dame on eight. Of the 1,264 persons who received doctorates in physics from American universities in that decade, 38 had received their college degrees in Indiana, as follows: Indiana University, 14; DePauw, five; Purdue, five; Notre Dame, four; Manchester, three; Butler, two; and Ball, Earlham, Franklin, Tri-State, and Valparaiso, one each.

### SCIENCE AND SCIENTISTS AT PURDUE UNIVERSITY

Nearly a quarter of the scientists sketched in this volume are graduates or present or former faculty members of Purdue University. Purdue conferred the bachelor's degree on 483, the doctorate on 361. Purdue University or the U. S. Experiment Station affiliated with it, have employed 625 of these scientists. Purdue University's contribution to science has been exceptionally broad, including several large groups not represented in most other Indiana schools. Examples are many score of agricultural and engineering scientists and large numbers of entomologists and plant and animal pathologists.

Purdue University from its beginning was a school of science, engineering, and agriculture, while most other Indiana schools started as liberal arts colleges, especially interested in the training of clergymen (in the earlier decades) or teachers or lawyers. Nearly all of the presidents of Purdue University have been scientists, in contrast to the situation in most other Indiana schools.

Purdue University has had large enrolments of men students, greater than has any other Indiana school almost from its founding, far greater than any other during recent decades except very recently, when Indiana University has approached or occasionally passed Purdue's total.

The departments of biology, chemistry, and physics have been conspicuously large at Purdue, partly because they supply basic training needed by future agriculturalists and engineers. They have, however, also trained many specialists. For example, Purdue University has awarded more than 3,000

masters' degrees in chemistry and more than 700 doctorates.

Of the doctorates awarded in science 1936-45 in all American universities, Purdue University conferred 285, ranking as sixteenth institution in this respect. In that decade, Purdue conferred seven doctorates in agriculture, one in bacteriology, 18 in biochemistry, five in botany, 155 in chemistry, 16 in engineering, one in entomology, one in horticulture, three in mathematics, 18 in pharmacology, 29 in physics, five in physiology, 22 in psychology, and four in zoology.

In addition to the large amount of graduate training implied by the data above, Purdue gave undergraduate training to many future scientists. For example, of those who obtained doctorates in science 1936-45 in any American university, Purdue had supplied undergraduate training (a college degree) to 117, classified by doctoral field as follows: agriculture, 11; astronomy, one; bacteriology, four; biochemistry, six; botany, seven; chemistry, 37; engineering, 11; entomology, two; genetics, one; horticulture, six; mathematics, one; metallurgy, four; pharmacology, eight; physics, five; physiology, one; psychology, six; and zoology, six.

Of the alumni of Purdue University, five have been starred in *American Men of Science* as especially distinguished in research. They are H. L. Bolley '88 (botany), H. M. McCoy '92 (chemistry), J. B. Shaw '89 (mathematics), and M. Luckiesh '09 and W. B. Nottingham '20 (physics).

Of the present or former members of the faculty, the following have been starred in *American Men of Science*: J. C. Arthur, E. M. Blake, H. L. Bolley, A. P. Carman, S. Coulter, A. W. Duff, E. S. Ferry, M. E. Gardner, H. B. Hass, H. S. Jackson, Walter Jones, J. S. Karling, F. D. Kern, K. Lark-Horovitz, D. T. MacDougal, E. B. Mains, L. W. Nordheim, C. R. Orton, L. C. Petry, R. B. Warder, F. A. Waterman, F. M. Webster, and H. W. Wiley. Most of these men served Purdue only briefly; but Arthur, Coulter, and Hass served for decades and Gardner, Jackson, Mains and Wiley for a dozen years or so.

In addition to the starred scientists, Purdue has had many distinguished professors, including 12 who have been president of the Indiana Academy of Science (J. C. Arthur, C. A. Behrens, S. Coulter, C. C. Davis, E. F. Degering, H. E. Enders, P. N. Evans, E. G. Mahin, M. G. Mellon, C. L. Porter, C. D. Waldo, and H. W. Wiley.)

Numerous other former or present faculty members and alumni merit listing. (Some are listed in the summaries as to chemistry and biology.)

## SCIENCE AND SCIENTISTS AT INDIANA UNIVERSITY

Of the scientists sketched in this volume, Indiana University conferred the bachelor of arts or science degree on 532, the doctor's degree on 328. No other school has more collegiate alumni represented, and only Purdue has more doctors.

In the number of male college students enrolled, Indiana University has been the second or third institution in the state. It has ranked high in the number of future scientists graduated, partly because relatively many have gone on in science after graduation.

Until 1879, when David Starr Jordan became professor, science was relatively unimportant at Indiana University. Many of the students became lawyers, non-specialized teachers, or physicians. Dr. Jordan, enthusiastic about scientific research, greatly stimulated interest in science. Especially during his years as president, 1885-91, he was able to mold Indiana University into a school of science rather than of law or language. His dynamic personality, his keen appreciation of the abilities of capable young men even though they were crude, and his effective example, all attracted an outstanding group of students. During his 12 years at Indiana University, more than three score later-distinguished scientists worked here. After he left in 1891 to become president of the new-established Stanford University, taking with him a considerable number of the faculty, a few years elapsed before Indiana University was again strong in science. However, in the years 1898-1907 it was again one of the nation's leaders in the field.

In the first seven editions of *American Men of Science*, 1906-1944, scientists were starred if especially distinguished for research, the decision being made by secret vote of their fellow scientists. Of the 81 scientists so starred who obtained college degrees in Indiana, Indiana University graduated 32, DePauw (long a larger school than Indiana University) graduated 12, Earlham eight, Wabash six, Purdue five, Hanover and Valparaiso each four, Butler and Rose three each, and

Evansville, Franklin, Manchester, and Notre Dame one each.

Of the 32 collegiate alumni of Indiana University who later were starred, 12 were starred in zoology, all students either of David Starr Jordan or of a student of his. Five of the 32 were starred in psychology, all but one also students of Dr. Jordan. Five were starred in astronomy, four of whom were students of John A. Miller, who was a student of Dr. Jordan. Three were starred in physics, two in botany, two in physiology, and one each in anthropology, geology, and pathology. (The names of these men are given in the section on starred scientists.)

In addition to the starred collegiate alumni are several starred higher-degree alumni, some of whom did their work under Dr. Jordan. There are also large numbers who have become prominent though not starred, including several in high administrative posts.

The first period of Indiana University's prominence in science arose, as already remarked, out of David Starr Jordan's influence. The second period is partly attributable to Charles H. Eigenmann, Jordan's successor as head of the department of zoology and the first dean of the graduate school. Dr. Eigenmann became such a distinguished scientist that he was elected to the National Academy of Science, the first professor in the state to be so honored. Dr. W. L. Bryan, made president of the University in 1902, was also highly significant in the second period. He had ambitious plans, a young faculty filled with hope, and a reasonably large group of talented students interested in science.

Five men who received the bachelor's degree the year of Dr. Bryan's election as president were later starred, partly as a result of their being aided to continue graduate work at Indiana University. Two graduates of the next year, 1903, are in the same category, as were two each of the next three years. Since 1906, however, only two men subsequently starred have graduated from Indiana University, a sharp contrast with the Jordan period or the early years of Dr. Bryan's administration. (Since 1906, 16 later-starred scientists have graduated from other Indiana colleges or universities.)

The decline in scientific output during 1907-37 was associated with the ebbing of the bright hopes aroused when Dr. Bryan became president and with the progressive aging of

heads of departments and deans. Significant also was the increasing percentage of graduates who entered business, law, medicine, or industry. Moreover, some of the truly stimulating professors of the early years accepted more attractive positions in other institutions, several of which offered better opportunities in science than did Indiana University.

When in 1937 President Bryan, then 77 years old, was succeeded by Herman B Wells, there came a new emphasis upon scholarly work. Since then the University has been notably strengthened, partly with younger productive scholars and partly with men of established reputations but still active, as well as with additional funds and equipment.

Of the scientists sketched in this book, Indiana University has employed for at least two years a total of 349, three times as many as the third institution but notably fewer than Purdue, first on the list because of the many employed there by the U. S. Experiment Station.

Indiana University has had on its faculty considerably more than half of the starred scientists working in the state. A total of about 40 starred or subsequently-starred scientists have been employed by Indiana University. These include the only members of the National Academy of Sciences employed in Indiana. Purdue has employed a total of 16 starred scientists, most of them only briefly. Rose Polytechnic has employed, mostly for long periods, four, Wabash four, DePauw four, and Earlham two.

Although in undergraduate work it is likely that Indiana University may have been second to DePauw in several of the individual sciences in 1950, it appears highly probable that in both undergraduate and graduate training, Indiana University again leads the state in science, as it did in the 1880's and early 1900's.

## SCIENCE AT THE UNIVERSITY OF NOTRE DAME

*By Kenneth N. Campbell*

The University of Notre Dame has had many distinguished scientists on its faculty and has trained many others. Of the scientists sketched in *Indiana Scientists*, 107 are collegiate alumni of Notre Dame and 95 are doctoral alumni.

Mathematics, botany and zoology were taught at Notre Dame as early as 1842, and the science department was or-

ganized in 1864. In 1867 a botanical garden and a science museum were started; the first building devoted to science was erected in 1883. Originally only a general B.S. degree was awarded, but in 1907 this was replaced by B.S. degrees in the individual sciences, and in 1920 separate departments for the several sciences were organized. The college of science now includes departments of biology, chemistry, physics, mathematics, and geology. The first Ph.D. in science was awarded in 1915, and at present most of the science departments offer programs leading to the doctoral degree.

### *Biology*

Notre Dame has had a succession of brilliant teachers in biology. Father Alexander Kirsch initiated a course in bacteriology in 1879 and wrote the first American textbook on comparative osteology of the vertebrates. Father J. A. Nieuwland, a student of Kirsch, was professor of botany 1904-21. He became especially distinguished for chemical researches, but his contributions to biology were substantial. These included the founding of *American Midland Naturalist* (1909), which is still published by the University. Doctorates in biology have been awarded since 1915.

The bacteriology laboratories became highly significant soon after Father George Albertson came in 1923. Following his death in 1931, James A. Reyniers directed bacteriological research. With the aid of associates, notably Philip Trexler and Robert Ervin, Professor Reyniers expanded the research program so widely that in 1950 it occupied three buildings. Much of the research has been financed with Federal funds because of its significance to public health problems.

### *Chemistry*

Instruction in chemistry commenced by 1852 and laboratory work by 1858, but chemistry was not strong until 1875, when Father John A. Zahm, sometimes called "the real founder of science at Notre Dame," came. He was a teacher of great merit, a good organizer, sincerely interested in science. He planned Science Hall.

Chemistry was the first department to offer a regular program for the doctorate. This was during the term of H. B. Froning as head (1921-42). Father Nieuwland transferred

to the department of chemistry about 1918 and resumed his experiments in chemistry. He had done his doctoral work on acetylene at the Catholic University. Father Nieuwland's chemical researches continued until his death and greatly stimulated interest in chemistry at Notre Dame. They were highly significant in leading to the first successful synthetic rubber (Neoprene) and won him a star in *American Men of Science*, as well as several other high honors, including the Nichols Medal. He was also widely known as an inspiring teacher, and many talented young men were attracted to do graduate work with him. At the time of his death, in 1936, there were 15 graduate students in the department. Father Nieuwland was president of the Indiana Academy of Science in 1934. In recent years, under the leadership of Charles C. Price, graduate study and research have continued to expand, until in 1950 there were about 80 graduate students. Chemistry was the first of the sciences to have its own building, Chemistry Hall, built in 1918.

Four departments allied to chemistry may be mentioned. Chemical engineering, started in 1912, became strong by 1942, since which date it has offered advanced degrees. Metallurgy commenced in 1925 and became a separate department in 1932, under Professor Edward Mahin (president of the Indiana Academy of Science in 1928). Work in pharmacy began in 1898 and continued until 1939. The department of agriculture, commenced in 1917 and discontinued in 1932, was also an affiliate of chemistry.

### *Physics*

Physics was taught by 1852 at Notre Dame, partly by men who also taught chemistry. Father Zahm was one of these and was author of an important textbook on the physics of sound. His brother, Albert Zahm, was one of Notre Dame's most distinguished alumni. He built the world's first wind tunnel for the study of aeronautical models and subsequently became the chief research engineer for the Curtiss Airplane Company and later chief of the U. S. Navy aerodynamic laboratory. Robert L. Greene, on the faculty 1895-1914, carried out successful experiments with wireless telegraphy during this time.

Physics became a separate department in 1936, and a Ph.D. program was started. By 1950 there were well-devel-

oped research programs in electronics, nuclear physics, and the physics of polymers, with about 50 graduate students.

### *Mathematics*

Although mathematics was taught early, a collegiate major in mathematics was first offered in 1920. In 1936 Dr. Karl Menger (starred in *American Men of Science*) became head of the department, and in 1937 Dr. Emil Artin joined the department. These men gave a strong impetus to the research in mathematics. Dr. Menger and Dr. Artin later left the department and Dr. Arnold Ross became head in 1946. Research has been expanded considerably since the war.

### *Geology*

A course in geology was first offered in 1863. In 1908 the department of mining engineering was established with Knowles B. Smith as head. When that department was discontinued in 1943, work in geology was transferred to the department of chemistry, but in 1948 a department of geology was established, with A. J. MacAlpin as head. He has assembled an excellent staff and initiated a research program.

## DEPAUW UNIVERSITY SCIENTISTS

*With the aid of Will E. Edington, DePauw University*

Of the scientists sketched in this volume, 212 were graduated from DePauw University. Only Indiana University and Purdue have graduated more. In proportion to the number of students enrolled, DePauw has stood second in the college training of Indiana scientists during the past hundred years and in recent years has stood first. During the decade 1936-45, 103 of DePauw's graduates received the Ph.D. in the sciences. In this respect, DePauw led Indiana schools in biology and mathematics, tied for first in geology and psychology, and stood second in physics and third in chemistry.

DePauw graduates have won distinction in numerous lines. Twelve have been starred in *American Men of Science*: D. T. MacDougal in *botany*; R. F. Bacon, G. L. Clark, M. R. Fenske, and S. A. Lattimore in *chemistry*; W. H. Furry, A. C. Longden, G. W. Stewart, and O. M. Stewart in *physics*; and B. M. Allen, F. M. McFarland, and W. A. Riley in *zoology*.

In addition to these twelve who have been starred, a considerable number have become distinguished scientists, including H. L. Barnett, H. T. Cook, Ray Dawson, R. Diettert, John Frazier, W. D. Gray, Charlotte L. Grant, V. Greulach, Jack Oswalt, O. K. Stark, and H. H. York in *botany*; R. A. Baker, O. K. Behrens, H. E. Carter, W. F. Hester, Percy Julian, E. C. Lathrop, J. L. Riebsomer, R. J. Robinson, L. H. Schmidt, and L. E. Stout in *chemistry*; C. S. Cook, R. Humphreys, W. Lozier, T. Stephenson, C. V. Strain, C. M. Turner, and C. A. Whitmer in *physics*; R. S. Daniel, T. N. Ewing, G. Finch, F. C. Frick, A. T. Gordon, Dale B. Harris, H. T. Manuel, D. G. Ryans, Bert Sappenfeld, and K. P. Wagoner in *psychology*; and E. Butcher, William Collings, William Hahnert, H. H. Lane, Richard Overman, A. J. Ramsay, H. W. Schoenborn, and Gilbert Woodside in *zoology*.

Of the DePauw faculty, a considerable number have been widely respected for their own scientific achievements, or as exceptionally successful teachers of future scientists. The following have been president of the Indiana Academy of Science: J. P. D. John, J. P. Naylor, W. M. Blanchard, W. E. Edington, T. G. Yuncker, and Winona Welch. Other faculty members clearly meriting mention here are H. J. Banker, John S. Bobbs, F. D. Brooks, Mel T. Cook, J. M. Fulmer, C. P. Hickman, O. P. Jenkins, W. E. Martin, W. C. Middleton, O. H. Smith, L. M. Underwood, and C. A. Waldo.

Another way in which DePauw has notably aided scientists is through its highly commendable program of scholarships (Rector and the president's) for outstanding students which have been available in recent decades. These scholarships and the excellent reputation of the instruction have attracted many exceptional students from other states as well as from Indiana.

## BUTLER UNIVERSITY'S CONTRIBUTION TO SCIENCE

*With the Aid of May Schaefer Iske, Butler University*

Of the Indiana scientists sketched in this volume, Butler University graduated 75 and employed 45 for at least two years. Of the graduates, three were starred in *American Men*

of *Science*: A. C. Cope, '29, in chemistry; and V. C. Twitty, '25, and C. H. Gilbert, '79, in zoology. Other distinguished alumni include botanists W. D. Billings, 33, S. A. Cain, '24, R. F. Daubenmire, '30, J. W. Fischer, '28, Noe Higinbotham, '35, J. A. Moore, '28, J. E. Potzger, '27, T. M. Sperry, '29, O. B. Stanley, '31, R. N. Webster, '33, and R. A. Whitmore, '40. In the medical sciences are J. O. Hutchens, '36, Dean Edward McGavran, '24, Jean Piatt, '32, R. F. Pitts, '29, Waide Price, '28, and D. M. Rioch, '20. Also notable are physicist Eugene Greuling, '37, zoologist F. M. Baumgartner, '31, and mathematician C. H. Forsyth, '06. Something about each of these men is given in the biographical sketches section.

Of the former faculty members, several were starred after leaving Butler. Harvey W. Wiley was professor at Butler for some years before going to Purdue. David Starr Jordan was on the faculty for five years, during which period he commenced the study of fishes for which he soon became world renowned. (He was led to study fishes partly by the enthusiasm of his student and collaborator C. H. Gilbert.) Oliver P. Hay was professor of natural science and chemistry 1879-92. It was during these years that he became interested in paleontology, in which field he later became distinguished. He was president of the Academy in 1891. A fourth subsequently-starred scientist on the Butler faculty was Richard B. Moore, professor of chemistry 1905-11.

Other distinguished scientists formerly on the faculty include Henry Lane Bruner, professor of zoology for 46 years from 1892, president of the Indiana Academy of Science in 1919; and Charles M. Palmer and Stanley A. Cain, '24, botanists.

Notable scientists on the present faculty include Ray C. Friesner, president of the Indiana Academy in 1936, and John E. Potzger, '27, both botanists; Nathan E. Pearson, zoologist; and Charles C. Josey, psychologist.

## WABASH COLLEGE AND SCIENCE

*By Willis H. Johnson, with Assistance from A. R. Bechtel,  
E. L. Haenisch, and Duane Roller  
Wabash College*

Wabash College has from its opening in 1834 had on its faculty a succession of productive scientists. Of the persons sketched in this volume, 54 were employed here at least briefly and 127 received college degrees here. The faculty has included about a dozen scientists who later were starred and one (Thomas) who was starred while on the faculty. One of the faculty was elected to the National Academy of Sciences after leaving Indiana. Of Wabash alumni, at least a score have become distinguished scientists. Six graduates and a number of students who left before graduation have won stars in *American Men of Science*. As noted elsewhere in this volume, Wabash was for decades one of the leading Indiana colleges in graduating future scientists.

Edmund O. Hovey, one of the founders of the College, taught geology, chemistry, and biology 1836-77. John Merle Coulter, professor of biology and geology 1879-91, was an outstanding leader in science, one of the founders and the second president of the Indiana Academy of Science. Several of his students became distinguished botanists. When Dr. Coulter succeeded David Starr Jordan as president of Indiana University in 1891, his successor at Wabash as head of biology was Mason B. Thomas. During Thomas' twenty years, a succession of students were stimulated and given preliminary training to become distinguished botanists. Donaldson Bodine was professor of zoology and geology for about twenty years (1895-1916). Professor Willis Johnson was in charge of zoology 1929-35 and has been since 1946. From 1935 to 1946 John Paul Scott was in charge. He, too, is widely respected for his research.

For the work in chemistry, the "great teacher," Alexander Smith, was brought from Scotland in 1890 and remained until 1894, when he went to the University of Chicago. One of his students, James B. Garner, was in charge 1901-14. L. B. Howell has been leading professor of chemistry since 1924. In physics, John L. Campbell was professor 1855-1902. "His great ability, personal charm and the prestige of his national reputation made him a power in the affairs of the Col-

lege during most of his 56 years of service." The present chief professor Duane Roller founded and edited for fifteen years the *American Journal of Physics*.

Four of these Wabash College faculty members have been president of the Indiana Academy of Science: J. L. Campbell, M. B. Thomas, D. Bodine, and, as mentioned above, John M. Coulter.

Among the alumni distinguished as scientists are G. T. Moore, G. N. Rose, E. W. Olive, Donald Reddick, H. H. Whetzel, J. R. Schram—all starred botanists—and H. W. Anderson, L. M. Massey, A. J. Moyer, and S. J. Record (botanists); C. E. Boord, E. C. Britton, J. O. Hendricks, F. H. Rhoades, and R. S. Schreiber (chemists); James Broxon, J. S. Houghan, C. E. Nurnberger, and M. B. Reynolds (physicists); and G. B. Castle, G. P. DuShane, W. D. Funkhauser, and J. D. Van Nuys (zoologists).

## SCIENTISTS AT AND FROM TERRE HAUTE

*By James F. Mackell, Indiana State Teachers College*

The smaller colleges of Indiana have made and are still making valuable contributions to science. In this respect the two at Terre Haute, Indiana State Teachers College and Rose Polytechnic Institute, claim a fair share of honors. Of the scientists sketched in this volume, 46 were graduates of Indiana State Teachers College or of its predecessor, the State Normal, and 27 were employed there at least two years.

One of the founders of the Indiana Academy of Science, Oliver P. Jenkins, was head of the department of biology 1883-86. Several of his students were inspired to become scientists. He contributed numerous papers to the Academy, and later, at Leland Stanford University, became a world-famous physiologist.

Barton Warren Evermann followed Dr. Jenkins as professor of biology. (Both were former students of David Starr Jordan.) Dr. Evermann became a famous ichthyologist and made many contributions to the Academy and to the scientific world.

Dr. Charles Redway Dryer was another scientist who left a lasting imprint upon science at Indiana State. He is still remembered by many who studied geography 1895-1920.

Josiah T. Scovell served on the faculty at Indiana State from 1872 to 1881, preceding Dr. Jenkins. Dr. Louis J. Rettger, a student of Dr. Jenkins, succeeded Dr. Evermann. Dr. Rettger is still widely remembered by public school science teachers of Indiana. These several early teachers encouraged their most promising students toward further study.

Professor Ulysses Cox, a co-worker with Dr. Rettger, was an ardent worker, an inspiration to all his botany and zoology students. Dr. Fred Donaghy, who succeeded Professor Cox, carried on his work with an earnestness rarely matched by a college teacher. Several young men were inspired by Dr. Donaghy to enter scientific careers.

Roscoe Hyde taught at Indiana State in his early years but later became famous at John Hopkins University as professor of immunology. There he taught many Indiana State students who had gone to Johns Hopkins for graduate study. Several of them have become distinguished scientists. Two are Dr. Horace Powell of Eli Lilly and Company, author of numerous papers, and Dr. Herald Cox, who is with the Lederle Laboratories in New York. Dr. Cox, an authority on Rickettsial diseases, is the recipient of many honors, both in America and in Europe.

Professors at Indiana State who have been president of the Indiana Academy of Science were Drs. Dryer (1911), Rettger (1929), and Mackell (1947).

Rose Polytechnic Institute was for some decades one of the outstanding engineering and scientific schools of America. During its early years it contributed much to the Indiana Academy of Science. Of its relatively small faculty, five have served as president of the Academy: T. C. Mendenhall (1890), W. A. Noyes (1894), Thomas Gray (1897), C. A. Waldo (1898), and C. L. Mees (1904), although two of these five (Mendenhall and Waldo) served after leaving Rose. Thirty-three former or present faculty members are sketched in this volume.

One of the great teachers at Rose was Thomas Gray, who served as professor of dynamic engineering for 20 years. He was the author of many papers on seismology and engineering. Another great scientist, Mendenhall, was president of the Institute from 1886 to 1889. He was the author of many papers, and was president of the American Association for the Advancement of Science in 1889. One of America's fore-

most chemists, Dr. Noyes, was professor of chemistry from 1886 to 1903. Dr. Waldo was professor of mathematics from 1883 to 1891. He was the author of textbooks and scholarly papers and influenced his many students and co-workers in numerous ways. Dr. Mees, another president of Rose Polytechnic, was an outstanding physicist. His years at Rose left a strong impression on the student body and upon the faculty. Dr. E. S. Johonnott was professor of physics from 1899 to 1925. He was a student of Dr. Michelson's at Chicago and contributed many papers to the Academy and to the national scientific journals.

Of the alumni of Rose, 43 are sketched in this volume. Three of these have been starred in *American Men of Science*: J. A. Parkhurst in astronomy and E. S. Johonnott and C. E. Mendenhall in physics. Several of the younger graduates are making great names for themselves. Leroy Wilson has climbed gradually from electrical engineer to his present position as president of the American Telephone and Telegraph Company.

Of the former members of the faculties of these two institutions, memorial portraits of the following have been published in the necrology pages of the various *Proceedings* of the Academy: U. O. Cox, Fred Donaghy, C. R. Dryer, B. W. Evermann, R. G. Gillum, Thomas Gray, O. P. Jenkins, Edwin Johonnott, W. A. McBeth, C. L. Mees, T. C. Mendenhall, W. A. Noyes, Josiah Scovell, F. C. Wagner, and C. B. Waldo.

## SCIENCE AT VALPARAISO UNIVERSITY

*With the aid of A. H. Meyer, Valparaiso University*

For some decades Valparaiso University was widely respected as a college where outstanding ability was recognized. Hence, numerous talented young men who were financially poor were attracted there. The number of alumni who have become distinguished is notable, especially in consideration of the fact that enrolments were small. Four scientists who were later starred in *American Men of Science* as especially distinguished in research were graduated from Valparaiso 1893-1910. During those years only two Indiana colleges or universities graduated more subsequently-starred scientists than did Valparaiso, and one of these graduated only one

more. Just two additional Indiana schools graduated in these years more than one subsequently-starred scientist.

Valparaiso's starred alumni are J. A. Anderson, '00 (astronomy); C. D. La Rue, '10 (botany); C. P. Stone, '10 (psychology); and J. E. Teeple, '93 (chemistry).

Other alumni scientists who are widely known include Ruben L. Kahn, '09, Henry G. Mundt, '06, and D. B. Phemister, '99 (prominent physicians and surgeons); and J. W. Yussey, '82, an especially distinguished mathematician.

Of the scientists sketched in this volume, Valparaiso graduated 50 and employed 33 for at least two years. It ranks eighth among Indiana schools in both of these categories.

Valparaiso University was relatively strong 1890-1910 in pharmacology, chemistry, and engineering.

## SCIENCE AND SCIENTISTS AT EARLHAM COLLEGE

Of the scientists sketched in this volume, Earlham College graduated 94 and employed 41 at least briefly.

Earlham College has graduated eight scientists who have been starred in *American Men of Science* as especially distinguished in research. They, with their science and college class, are: W. C. Allee, '08, and C. Grave, '95 (zoology); H. E. Howe, '01, W. M. Stanley, '26, and R. B. Warder, '66 (chemistry); P. E. Goddard, '92 (anthropology); L. C. Petry, '07 (botany); and W. R. Miles, '08 (psychology). Of these, Allee and Stanley are members of the National Academy of Science, and Stanley has won a Nobel prize. Only two Indiana schools (Indiana University and DePauw) have as many college alumni who have been starred.

Earlham College has had on its faculty two starred scientists, especially the prominent chemist H. N. Holmes (1907-14). Two of its faculty have been president of the Indiana Academy of Science, D. W. Dennis (1900) and M. S. Markle (1945).

Of 14,000 graduates of American colleges who obtained doctorates in science 1936-45, 11 obtained their college degree from Earlham. Four of these won doctorates in zoology, two in chemistry, and one each in biochemistry, botany, geology, physics, and public health.

In relation to the number of male graduates of 1924-1934 who were sketched in *American Men of Science* 1949, Earl-

ham ranked fourth among all American colleges and universities. (DePauw ranked eighth, Wabash 36, Butler 47, according that study, in *Science*, May 11, 1951.)

Other prominent alumni include Daniel Shoemaker, '94, and E. O. Wooten, '89, long botanists with the U. S. D. A., and A. D. Hole, '97, long professor of geology at Earlham. Harold Urey, Indiana's first Nobel prize winner, became interested in research while a student at Earlham under the starred chemist Holmes. (Urey graduated elsewhere.)

### SOMETHING AS TO SCIENTISTS AT OR FROM OTHER INDIANA COLLEGES

Separate summaries are given in this chapter as to science and scientists at Butler, DePauw, Earlham, Indiana, Indiana State Teachers, Notre Dame, Rose, Valparaiso, and Wabash. Here are a few comparable facts as to other Indiana colleges.

Of the scientists sketched in this book, Manchester College graduated 31, Hanover 21, Franklin 19, Indiana Central 18, Evansville 11, Marion ten, Taylor and Tri-State each nine, Ball State, Goshen, and Oakland City each eight, Moores Hill (now Evansville College) six, Danville (now Canterbury) four, Winona and Indiana Technical College (Ft. Wayne) each two, and St. Joseph's and St. Mary's each one.

Of the alumni of these colleges, seven have been starred in *American Men of Science* as especially distinguished in research. These with college, science, and class are: *Evansville*, J. F. Dashiell, '08 (psychology); *Franklin*, O. W. Caldwell, '94 (botany); *Hanover*, C. R. Barnes, '77, J. M. Coulter, '70, S. Coulter, '77 (botany), and H. W. Wiley, '67 (chemistry); and *Manchester*, D. J. Flory, '31 (chemistry).

Of 14,000 graduates of American colleges who obtained doctorates in science in American universities 1936-45, 60 had obtained their college degree from one of the aforementioned Indiana colleges. The number from each and the doctoral field are as follows: *Ball*, five (chemistry two, mathematics, physics, and entomology one each); *Canterbury*, one; *Evansville*, seven (all chemistry); *Franklin*, four (chemistry three); *Goshen*, four; *Hanover*, eight (chemistry five, geology, mathematics, and botany one each); *Indiana Central*, three (zoology two, botany one); *Manchester*, 21 (chemistry

14, physics three, physiology two, botany and entomology one each); *Marion*, one; *Oakland City*, three (mathematics two); *St. Joseph's*, *St. Mary's* and *St. Mary-of-the-Woods*, one each.

Of the present or former members of the faculties of these colleges, the following have been president of the Indiana Academy of Science: *Hanover*, Glenn Culbertson; *Indiana Central*, W. P. Morgan; *Moore's Hill*, A. J. Bigney.

## SCIENTISTS AND SCIENCE AT ELI LILLY AND COMPANY

*With the Aid of John S. Wright*

Eli Lilly and Company is second only to the Standard Oil Company of Indiana among the Indiana industrial concerns in the number of scientists sketched employed. A total of 108 have been employed for two years or longer. Many of the Lilly men are highly resourceful and have contributed notably to science. Three have been starred in *American Men of Science* and one, after he left Indiana, was elected to the National Academy of Sciences. Some of those who have won recognition for their scientific achievements are Drs. G. H. A. Clowes, K. K. Chen, Irvine H. Page, G. B. Walden, M. E. Krahll, Homer Smith, W. A. Hanley, E. D. Campbell, E. C. Kleiderer, W. W. Davis, T. P. Carney, J. A. Leighty, Ewald Rohrmann, R. M. Rice, F. B. Peck, K. G. Kohlstaedt, C. G. Weigand, C. G. Culbertson, J. M. McGuire, O. K. Behrens, J. H. Waldo, H. M. Powell, P. N. Harris, and Edward Swanson. The sketches of these men elsewhere in this volume tell something of their achievements. (Fuller statements may be found in *Who's Who in America* or in *American Men of Science*.)

Eli Lilly and Company has contributed significantly to Indiana science in at least four ways: (1) It has developed commercially drugs discovered elsewhere. Examples are insulin, discovered at the University of Toronto, and liver extract, discovered at Harvard. The difficult work of their refinement, production, and distribution at a reasonable price was done by Eli Lilly and Company. (2) Several highly significant drugs were discovered by the Lilly research scientists. Examples are 'Amytal' and 'Seconal'. (3) Eli Lilly

and Company affords employment and exceptionally favorable working conditions to numerous young men of promise, aiding them to become productive research men. In addition to the 108 men sketched in this volume are numerous Lilly employees who have contributed significantly, or who will in time win recognition as scientists. (4) In 1935 Eli Lilly and Company began making annual awards to scientists under thirty-five years of age selected by the American Chemical Society for outstanding achievement. Since then similar awards have been made available through four additional national associations for advancement of knowledge pertaining to health, disease, and therapy. Each award consists of a medal, a prize of \$1,000, and a travel fund of \$150. To 1950 there have been forty-three such awards. Eli Lilly and Company has no part in selecting the winners. It merely pays the awards on certification of the winner by one of the five associations that make the selections.

#### COMMERCIAL SOLVENTS AND MEAD-JOHNSON AND SCIENCE

These two concerns have employed for two years or longer about 50 and 12, respectively, of the scientists sketched in this volume. In addition to affording these men, and many others, opportunities to do research, they merit special mention in another way. Both of them have followed the example set by Eli Lilly and Company of awarding a \$1,000 prize annually for outstanding research done in some field of special interest to them. The Mead-Johnson prize has been annually for several years; the Commercial Solvents prize was established in 1950.

#### BIOLOGY AND BIOLOGISTS AT PURDUE UNIVERSITY

The biologists at Purdue University are scattered through several departments. Botanists, bacteriologists, zoologists, and one biophysicist are employed by the Department of Biological Sciences in the College of Science. In the Agricultural College several of the departments have biologists on the staff; among them are Botany, and Plant Pathology,

Forestry, Horticulture, Entomology, and Animal Husbandry.

A succession of Purdue botanists starred in *American Men of Science* includes: J. C. Arthur, Stanley Coulter, Max Gardner, H. S. Jackson, J. S. Karling, and E. B. Mains. Most of these men have headed either the Department of Biological Sciences or the Department of Botany and Plant Pathology. Other starred botanists who were on the faculty for shorter periods were H. L. Bolley, F. D. Kerns, D. T. MacDougal, and C. R. Orton. One starred zoologist, F. M. Webster, has been on the Purdue faculty (1884-88).

Purdue professors in biological departments who have been president of the Indiana Academy of Science are J. C. Arthur, Stanley Coulter and C. L. Porter (botanists), C. C. Davis and H. E. Enders (zoologists), and C. D. Behrens (bacteriologist).

A considerable number of graduates in biology at Purdue have become significant scientists, but only one with a college degree (H. L. Bolley '88) has been starred in *American Men of Science*. C. H. Werkman, who graduated in bacteriology in 1919, has, however, been elected to the National Academy of Sciences. Many of the faculty and alumni have worked on aspects of their subjects of practical significance but which, under the restricted system used for starring in *American Men of Science*, rate less high than certain aspects of less immediate practical significance.

An outgrowth of the department of biology (now Biological Sciences) is the department of forestry, established partly as a result of Dean Stanley Coulter's great interest in forestry. One phase of the forestry work meriting mention is conservation. (A summary as to conservation is given elsewhere in this chapter.)

During the decade 1936-45 Purdue University conferred five doctorates in botany, four in zoology, and one in bacteriology. Of those who obtained doctorates in the biological sciences in American universities in that decade, 21 had obtained their college degree at Purdue, as follows: in bacteriology, four; in botany, seven; entomology, two; genetics, one; zoology, six; and physiology, one.

## CHEMISTRY AND CHEMISTS AT PURDUE UNIVERSITY

*By F. J. Allen, Purdue University*

It is the purpose here to set forth briefly the development of the department of chemistry at Purdue University. Those in charge of the work are mentioned, with dates of their tenure as department head.

Harvey W. Wiley gave chemistry its start at Purdue when the University opened in 1874. That it was only a small beginning is shown by the fact that Wiley served also as professor of physics, state chemist, and director of military work. Wiley is best known in connection with pure food laws, which were practically his life work after 1883, the year he left Purdue.

Robt. B. Warder (1883-87), like Wiley, was state chemist in addition to teacher of chemistry. John Ulric Nef (1887-89) started some of the researches which subsequently made him nationally famous. Winthrop Ellsworth Stone had a great influence both as head of chemistry (1889-1900) and as president of the University for 21 years. Percy Norton Evans (1900-25) served as head and professor of organic chemistry until his death. As division heads under Evans were R. H. Carr in agricultural chemistry, L. A. Test in general chemistry, E. G. Mahin in quantitative analysis, A. R. Middleton in qualitative analysis, and F. O. Anderegg in physical chemistry. J. H. Ransom, one of Purdue's great teachers, also served as head of general chemistry under Evans (1909-18). In the period 1874-1924, only 16 men had served as full professors.

In 1922 Edward C. Elliott became the president of Purdue University and greatly expanded research.

R. B. Moore (1926-30) succeeded Dr. Evans as head of chemistry and in addition was dean of the school of science. Dr. Moore, long with the Bureau of Mines, had an international reputation for his work on radium and helium. In spite of poor health, he played a tremendous role in a few years in promoting research and in supervising plans for a new building, which he saw partially occupied in 1930.

A. R. Middleton had served as acting head of the department 1925-26, and was called on again in 1931. The professorial staff about this time was as follows: R. C. Corley

in biological chemistry; Middleton and L. A. Test in inorganic; M. G. Mellon in analytical; R. E. Nelson, H. B. Hass, and E. F. Degering in organic; R. F. Newton, T. DeVries, F. D. Martin, J. F. Chittum, and H. Hunt in physical; and R. H. Carr in food chemistry.

H. B. Hass (1937-49) assumed the headship in 1937. He held to high standards for the undergraduate courses, but will probably be best remembered for his research interests and the development of graduate work.

E. T. McBee (1949- ), an expert in fluorine chemistry, succeeded Dr. Hass, who left to become research director in chemical industry. As of September, 1950, the chemistry staff of professorial rank consisted of A. A. Alberts, F. J. Allen, G. B. Bachman, C. Beatty, R. A. Benkeser, W. W. Brandt, J. H. Brewster, H. C. Brown, R. C. Corley, T. De Vries, W. F. Edgell, H. Feuer, H. Hunt, H. W. Johnston, N. Kornblum, R. L. Livingston, E. T. McBee, F. D. Martin, M. G. Mellon, H. C. Reitz, A. L. Rocklin, A. W. Searcy, and W. E. Truce—this in contrast to the one-man staff of Harvey Wiley in 1874.

The number of degrees given each year in each of several categories are shown in a table not reproduced here.

In brief: the first master's degree was given in 1886 but only two before 1889, when five were given. In most years since 1889 several were given, until 1937, since which date 11 to 56 have been awarded annually nearly every year. The total to 1951 is 373. Masters' degrees in chemistry and metallurgy 1924-50 total 175. Masters' in agricultural chemistry 1925-50 total 40. The total of masters' in pharmacy is 197. They started in 1929. The grand total of masters' degrees in chemistry and allied fields is 3,172, with 100 to 200 awarded in 1933, in 1939-42, and in 1946, and with totals of 226 to 486 annually in more recent years.

One Ph.D. was awarded in chemistry in 1897 but no other until 1930. During the next five years, 12 were awarded, and commencing in 1935, from five to 27 per year, with a total to 1951 of 267. A doctorate in "chemistry and metallurgy" was first awarded in 1935, since which date from one to eight have been awarded annually except twice. The total to 1951 is 48. Doctorates in agricultural chemistry began in 1933, reached a total of 43 in 1950. Pharmacy doctorates (Ph.D.) commenced in 1932, reached a total of 52 in 1950.

The total of all doctorates reached a total of 704 in 1950. High years were 1942 (59), 1947 (59), 1948 (79), 1949 (101), and 1950 (97).

The laboratories of the state chemist and of allied departments in the Experiment Station have performed much routine work, but have also made important contributions. Meriting special mention is the work by S. D. Conner on soil chemistry; of Geo. Spitzer on the chemical and physical nature of butter and butter adulterants (internationally-recognized studies).

Pharmacy started early, in 1884, under the guidance of J. N. Hurty. Its development owes much to Dean C. B. Jordan, who was succeeded in 1941 by Dean G. L. Jenkins.

Some work had been given in chemical engineering by 1906. The offerings were expanded and a school of chemical engineering officially established in 1911 under the direction of H. C. Pfeffer. John Bray succeeded Pfeffer, and R. N. Shreve in turn succeeded Bray.

A few Purdue people whose distinction is partially attributable to their training in chemistry deserve mention. Most of these persons are listed elsewhere in this volume, but some are not, since they are not considered primarily scientists. It is generally conceded that the greater salaries to men of executive and managerial ability have lured many capable men from the pursuit of less profitable research. This process has had valuable by-products, however, in that the energy and initiative of these scientifically-intelligent executives have provided places for many research workers. In this category are men such as Richard Egli, R. H. Ewell, T. L. Fritzlen, B. W. Gorser, H. G. Hortsman, W. E. Kruse, John R. Leighty, P. A. McLeod, A. B. Nixon, George Perkins, Harley W. Rhodhamel, R. E. Sheffer, J. C. Siegesmund, Games Slayter, R. L. Stern, D. H. Tilson, Chas. H. Viol, J. E. Whallon, Maynard Wheeler, and D. R. Wiggam. More will follow in future years.

Finally, Purdue has recognized the following men with the honorary doctor of science degree, all of whom have an earned degree from Purdue: Francis Eugene Bibbins, Clifford Cook Furnas, George Nissley Hoffer, Herbert N. McCoy, Edward G. Mahin, Julius William Sturmer, and Charles Edwin Vanderkleed.

## CHEMISTRY AT INDIANA UNIVERSITY

*By Frank C. Mathers, Indiana University*

The teaching of chemistry commenced in 1828 under a professor who also taught "natural philosophy." A building devoted to chemistry and to the library was completed in 1836. Professor T. A. Wylie taught chemistry for some years following 1837 and again 1854-62. Professor Richard Dale Owen taught chemistry and geology 1864-74.

In 1874 the first full-time professor of chemistry was appointed (T. C. Van Nuys). In 1885 Wylie Hall was completed, designed especially for chemistry and so used until the present large Chemistry Building was completed in 1931.

Dr. Robert E. Lyons became an instructor in 1889 and head of the department in 1895, in which capacity he served until 1939. His associates included Sherman Davis (1892-1927), Oliver W. Brown (1899-1943), Frank C. Mathers (1903-50), and Clarence May (1908- ). Herman T. Briscoe became an instructor in 1927 and was head of the department 1939-41. Robert J. Hartman and E. W. Kanning were on the staff 1930-42.

Dr. Ralph L. Shriner was head of the department 1941-46, and Dr. Frank T. Gucker has headed the work since 1947. Both Shriner and Gucker are starred in *American Men of Science*.

Many of the students in chemistry have become physicians. Three who as undergraduates majored in chemistry and later became distinguished physicians are W. D. Gatch, long dean of the Indiana University school of medicine, R. R. Sayers, director of the U. S. Bureau of Public Health and later of the U. S. Bureau of Mines, and Charles Clark, medical director of a large life insurance company.

Several chemistry alumni have become notable professors. Data as to their locations are given in the biographical part of this volume. This group includes Chester Alter, R. L. Bateman, W. E. Bradt, L. L. Carriek, J. L. Culbertson, W. A. Fletcher, J. O. Frank, F. E. Germann, F. L. Griffiths, R. J. Grim, M. E. Holmes, Hoyt Hottel, Hershel Hunt, C. F. King, Florence King, F. C. Krauskopf, O. R. Overman, Jacob Papish, L. F. Rettger, H. E. Ritchey, F. L. Shinn, J. C. Warner, and Frank Welcher.

A considerable number of graduates in chemistry at In-

diana University have become industrial chemists. Among the more successful, sketched in this volume, are: Paul Carlisle, J. N. Currie, George Hale, E. C. Medcalf, K. W. Ray, W. J. Sparks, E. H. Stuart, and Verling Votaw. Several alumni have become prominent business executives; two sketched here as scientists are W. H. Bell and Judson West.

Both faculty and alumni have made numerous chemical discoveries and have received many patents. Several have become wealthy. Professor Briscoe's elementary textbook has been very widely used, and treatises by Shriner and Gucker are also widely recognized.

The first Ph.D. was awarded in 1921. By 1951, 149 had been awarded, 70 during 1936-45. In 1950, the faculty consisted of 17 men with a rank above instructor. The full professors were H. G. Day, F. T. Gucker, F. Haurowitz, F. C. Mathers, and C. E. May. In 1950, there were 21 research fellowships and research assistantships financed by grants totaling \$76,000 from industrial concerns, foundations, and federal agencies.

Alumni who were awarded LL.D. degrees at the dedication of the Chemistry Building in 1931 are Earl Blough, J. N. Currie, F. Isobe, O. C. Martin, O. H. Perry, and L. F. Rettger. Other alumni who have attained high rank in other fields include Donald Ballman, Roy Bonsib, Lyle Gilbertson, Deloso Grant, George Hale, Russel Hardy, J. R. Krebler, Herschel Newsom, Fred Shetterly, Milo Summerville, Louis Watson, and H. F. Willkie.

## PHYSICS AND PHYSICISTS AT INDIANA UNIVERSITY

Physics, then often called natural philosophy, was taught at Indiana University as early as 1831. Theophilus A. Wylie taught it 1837-86, with some gaps, one of which was filled by Richard Dale Owen, who taught "physical science" for several years following 1863. Upon Dr. Wylie's retirement in 1886, J. P. Naylor became head of the newly-established department of physics. He left in 1891 for DePauw, and was succeeded by Benjamin W. Snow, who after a year went to Wisconsin. Arthur L. Foley, a student of Naylor's, became an instructor in 1890 and head of the department in 1897, where he served until he retired in 1938. Distinguished espe-

cially for his work on sound, particularly as related to locomotive whistles, acoustic horns, microphones, and architecture, he was starred in *American Men of Science*, as were two of his students, C. T. Knipp, '94, and F. C. Brown, '04. His college textbook, completed shortly before he retired, has been widely used. Dr. Foley and one of his associates, R. R. Ramsey, were president of the Indiana Academy of Science in 1909 and in 1930, and another member of the faculty, M. E. Hufford, was vice president in 1948. A fourth, J. B. Dutcher, was classed by many as an exceptionally successful teacher.

Dr. Foley's successor as head of the department is Allan C. G. Mitchell, also starred. Under him, staff and facilities have expanded notably, associated in part with moving into expanded quarters in a building finished in 1940. The equipment includes a cyclotron which delivers beams of high energy particles.

The research since 1938 has consisted largely of work in nuclear and theoretical physics. The outstanding recent contribution has been in nuclear spectroscopy, by Mitchell, L. M. Langer, and R. G. Wilkinson.

Work with the cyclotron, under the supervision of M. B. Sampson, is directed toward the study of nuclear energy levels excited as a result of high energy reactions. E. J. Konopinski is in charge of theoretical physics and has made significant contributions to the theory of beta-ray decay and nuclear reactions. Cosmic rays are being studied by J. G. Retallack and R. W. Thompson. Charles Hire is in charge of beginning physics lectures.

During the decade 1936-45, the department conferred 21 doctorates. Its earlier success with undergraduate students is implied by the fact that of the persons who obtained doctorates in physics anywhere in the United States in that decade, 14 had their undergraduate work at Indiana University. This is in contrast to five, the figure for the next highest Indiana school, and is 37 per cent of the total for the state.

## ZOOLOGY AT INDIANA UNIVERSITY

The department of zoology at Indiana University has long been widely considered one of the strongest in America. It has won this high reputation by the notable achievements of its faculty and alumni.

Although zoology was taught for decades before then, the subject first received considerable attention when David Starr Jordan became professor of zoology in 1879, when he was 28 years old. During the next 12 years, more than a score of students who later became prominent scientists studied under Jordan and did valuable research. Dr. Jordan himself did a large amount of scholarly work and much else that added to his reputation and that of Indiana University.

When Dr. Jordan left in 1891 to become president of Stanford University, one of his students, C. H. Eigenmann, became head of the department. Under his leadership, zoology at Indiana University continued to attract able students, several of whom later became distinguished. Dr. Eigenmann himself did such notable research that he was elected to the National Academy of Sciences, the first professor in the state to win that high recognition.

Upon Dr. Eigenmann's death in 1927, Fernandus Payne, a student of his, became head of zoology (and dean of the graduate school). The department continued to expand and grow in reputation. In 1950, its staff included the only Nobel prize winner in Indiana, H. J. Muller; two members of the National Academy of Science, Muller and T. M. Sonneborn; and other widely- and deeply-respected men, including, perhaps the most talked about professor in America, A. C. Kinsey.

Graduates of the department who have been starred in *American Men of Science* are Joel A. Allen, Ph.D. '86; A. M. Banta, '03; C. L. Edwards, '86; C. H. Eigenmann, '86; B. W. Evermann, '86; Stephen A. Forbes, Ph.D. '84; C. H. Gilbert, M.S. '82, Ph.D. '83; O. P. Hay, Ph.D. '84; C. Juday, '96; C. H. Kennedy, '02; W. L. McAtee, '04; N. E. McIndoo, '06; W. J. Moenkhaus, '94; F. Payne, '05; F. H. Pike, '03; and O. Riddle, '02.

Former or present faculty members who have been starred include, in addition to the alumni listed in the foregoing paragraph, D. S. Jordan, A. C. Kinsey, J. S. Kingsley, W. H. Manwaring, H. J. Muller, G. J. Pierce, T. M. Sonneborn, A. S. Warthin and Charles Zeleny. Several other faculty members or alumni have contributed notably to the advancement of zoology. These include W. R. Breneman, Lowell Coggeshall, S. D. Gerking, Ralph Hile, L. A. Krumholz, W. E. Ricker, Will Scott, J. R. Slonaker, T. W. Torrey, Ralph Voris, and W. J. Van Wagentonk.

Professors who became president of the Indiana Academy of Science were Jordan, in 1885-86, Eigenmann, in 1899, Moenkhaus, 1917, Payne, 1932, and Scott, 1935. These faculty members were all graduated from the department except Jordan. Alumni who have not been local professors who have served as president of the Academy are W. S. Blatchley, in 1903, Robert Hessler, in 1906, E. B. Williamson, 1918, and W. P. Morgan, 1951.

Additional alumni who have made significant contributions to zoology include W. R. Allen, O. P. Breland, Robert Bugbee, John Haseman, Leonard Haseman, T. H. Headlee, O. P. Jenkins, W. P. Morgan, N. E. Pearson, Meredith Runner, A. B. Ulrey, and Don Warren.

The first master's degree in zoology was given in 1882, the first doctorate in 1883. During the years 1883-92, fourteen Ph.D.'s were awarded (some of them semi-honorary). From 1893-1920 no doctorates were granted. During 1936-45, 13 doctorates were awarded. In 1950 there were many candidates.

An increasing proportion of the undergraduate students in the department are pre-medics. However, at the same time there are an increasing number of graduate students, attracted partly by the world-renowned faculty.

## CHAPTER IV

### ADDITIONAL DATA ON INDIANA SCIENTISTS

#### ESPECIALLY DISTINGUISHED INDIANA SCIENTISTS

Nobel prizes have been awarded to two natives of Indiana, W. M. Stanley and H. C. Urey, and to a resident, H. J. Muller. Of the American Association for the Advancement of Science, Dr. T. C. Mendenhall was president while he was president of Rose Polytechnic Institute; and Drs. D. S. Jordan and J. M. Coulter, leaders in science in Indiana 1875-91, were president after they left the state.

Nineteen Hoosiers have already been elected to the National Academy of Sciences: W. C. Allee, C. P. Berkey, J. S. Billings, L. A. DuBridge, C. A. Kraus, F. C. Mann, E. Meritt, W. A. Noyes, Jr., F. W. Reichelderfer, O. Riddle, V. M. Slipper, Lee J. Smith, W. M. Stanley, C. P. Stone, Lewis Terman, his son Frederick Terman, H. C. Urey, C. H. Werthman, and Clark Wissler. Four non-natives were elected while working in Indiana: C. H. Eigenmann, R. E. Cleland, T. R. Sonneborn, and Robert E. Wilson (Dr. Wilson was with the Standard Oil Company of Indiana and the others were at Indiana University). The following six persons who had taught in Indiana were elected after leaving the state: J. C. Branner, D. H. Campbell, J. M. Coulter, T. C. Mendenhall, W. A. Noyes, and B. F. Skinner. Of these, Mendenhall and Noyes were at Rose Polytechnic Institute, and Branner, Campbell and Skinner, at Indiana University. Coulter taught at Hanover and Wabash and was president of Indiana University 1891-93. One former employee of Eli Lilly and Company, Homer W. Smith, also has been elected to the Academy.

Eighty-one native Hoosiers have been starred in *American Men of Science*, by secret vote of their fellow workers, as especially distinguished in research. Thirty-one who later won stars came into Indiana for their college training. The names of these men are given in the section on starred scientists in Chapter V. About 50 former Indiana faculty members who were neither natives nor graduates of Indiana schools have also been starred, most of them after leaving Indiana. Three former employees of Eli Lilly and Company and two of Standard Oil of Indiana have also been starred, as have two former high school teachers—none of them natives or local alumni. The ex-faculty members are listed in the

summaries as to the leading universities in Chapter III.

Thus, 164 starred scientists are sketched in this volume and comprise nearly four per cent of the number of persons sketched.

Of these 164, Indiana University graduated (college degree) 32 and employed 36; Purdue graduated five, employed 18 (several of them briefly); DePauw graduated 12, employed four; Wabash graduated six, employed five; Earlham graduated eight, employed two; Rose Polytechnic graduated three, employed four; Hanover graduated four, employed two; Butler graduated three, employed two; Notre Dame graduated one, employed two; Valparaiso gave four their first college degree, while Evansville, Franklin, and Manchester each graduated one. (The names of the graduates are given in the special section dealing with starred scientists in Chapter V, as well as in sketches.)

## PRESIDENTS OF THE INDIANA ACADEMY OF SCIENCE, 1885-1951

## CHARTER MEMBERS OF THE INDIANA ACADEMY OF SCIENCE

*By Will E. Edington, DePauw University*

Although the records as to certain of the following names are not clear, from the evidence now available, the charter members of the Academy (which includes persons who joined during the first year) were as here given. The dates of their birth and death, so far as known to me, are also given.

J. C. Arthur (1850-1942); Philip S. Baker (1851-1901); George W. Benton (1862- ); A. J. Bigney (1864-1929); W. S. Blatchley (1859-1940); John C. Branner (1850-1922); A. W. Brayton (1848-1926); Ryland T. Brown (1807-90); J. B. Burris (1859-1935); Amos W. Butler (1860-1937); John L. Campbell (1827-1904); Arthur B. Chaffee (1852- ); J. B. Conner; John M. Coulter (1851-1928); Stanley Coulter

(1853-1943); D. W. Dennis (1849-1916); C. R. Dryer (1850-1927); C. H. Eigenmann (1863-1927); B. W. Evermann (1853-1932); William H. Fogg; Morton W. Fordice (1864-1939); E. E. Glover; G. K. Green; Charles W. Hargitt (1852-1927); Oliver P. Hay (1846-1930); Robert Hessler (1861-1942); Orlando Hobbs; W. DeM. Hooper; J. N. Hurty (1852-1925); Henry A. Huston (1858- ); Henry Jameson (1848-1924); O. P. Jenkins (1850-1935); J. P. D. John (1843-1916); D. S. Jordan (1851-1931); J. S. Kingsley (1854-1929); Daniel Kirkwood (1814-94); Lillian J. Martin (1851-1943); T. J. McAvoy; R. W. McBride (1842-1926); Jerome McNeill (1857-1928); Seth E. Meek (1859-1914); David R. Moore (1850-1932); Joseph Moore (1832-1906); David M. Mottier (1864-1940); W. H. Mushlitz; J. P. Naylor (1853-1938); Fletcher M. Noe; W. A. Noyes (1857-1941); H. L. Osborn (1857- ); D. A. Owen (1852-1930); Richard Owen (1810-90); A. J. Phinney (1850-1942); A. B. Porter (1864-1909); G. W. Puterbaugh; E. R. Quick (1851- ); W. H. Ragan ( -1908); T. B. Redding (1831-95); J. T. Scovell (1841-1915); W. P. Shannon (1847-97); Frederick Stein; J. O. Stillson (1850-1926); S. P. Stoddard; Maurice Thompson (1844-1901); C. A. Waldo (1852-1926); Robert B. Warder (1848-1905); L. D. Waterman (1830-1918); F. M. Webster (1846-1916); Harvey W. Wiley (1844-1930); T. A. Wiley (1810-95).

## INDIANA SCHOOLS AND DOCTORATES IN SCIENCE, 1936-45

Some Data from *The Baccalaureate Origins of the Science Doctorates Awarded in the United States 1936-1945*, Office of Scientific Personnel, National Research Council  
(Washington, D. C., June, 1948)

I. Science doctorates awarded by Indiana schools 1936-1945 are as follows:

*Purdue*: Agriculture, 7, Biochemistry 18, Botany 5, Chemistry 155, Engineering 16, Pharmacology 18, Physics 29, Physiology 5, Psychology 22, Zoology 4, other 6

Total - 285

*Indiana U*: Botany 9, Chemistry 68, Physics 21, Psychology 22, Zoology 13, other 9

Total - 130

*Notre Dame*: Chemistry 61, Mathematics 4, Metallurgy 4, Physics 8, other 4

Total - 81

Purdue ranked 16th in the number of doctorates awarded by institutions in the United States; Indiana U, 31st; and Notre Dame, 41st.

Indiana institutions (Purdue, Indiana, and Notre Dame) granted 496 of the 14,905 doctorates awarded, or 3.32 per cent.

II. Of those receiving doctorates in science in the United States 1936-1945, the number who received their college degree from each Indiana school represented, follows:

Ball 5, Butler 22, DePauw 103, Earlham 11, Evansville 7, Franklin 4, Goshen 4, Hanover 8, Indiana Central 3, Indiana State Teachers 7, Indiana U. 105, Manchester 21, Notre Dame 55, Oakland City 3, Purdue 117, Rose 6, Taylor 4, Tri-State 4, Valparaiso 5, Wabash 28, and Canterbury, Marion, St. Joseph's, St. Mary-of-the-Woods, and St. Mary's each 1.

526, or about 3.5 per cent of the baccalaureate degrees, came from Indiana schools.

Nineteen American institutions had given more baccalaureate degrees to recipients (1936-45) of science doctorates than had Purdue; 26 more than had Indiana U; 27 were above DePauw; and 58 above Notre Dame.

III. Of the doctorates awarded 1936-45 in *biology*, 35 went to persons who had been graduated from DePauw; 21, from Purdue; 12 each, from Butler and Indiana U; 8, from Wabash; and 5, from Notre Dame and from Earlham. Figures for other sciences follow:

*Chemistry* - Indiana U 62, Purdue 55, DePauw 46, Notre Dame 44, Wabash 18, Manchester 14, Evansville 7, Hanover 5, and Rose 5

*Geology* - DePauw 5, and Indiana 5

*Mathematics* - DePauw 4 (No other Indiana college even one)

*Physics* - Indiana 14, DePauw 5, and Purdue 5

*Psychology* - DePauw 7, Indiana 7, and Purdue 6

## WOMEN SKETCHED IN INDIANA SCIENTISTS

Of 199 women sketched in this volume, 46 give chemistry as their science, 54 are biologists (botany, zoology, biology, ecology, etc.), 25 are psychologists, 15 mathematicians, 15 nutrition experts, 11 physicists, six bacteriologists, five physiologists, five geologists, three geographers, three astronomers, three are in education, and one each in medicine, pharmacology, anthropology, public health, and textiles.

(Thirty-five names are so unusual that they give no indication to the writer and his associates of whether the bearers are men or women.)

Women scientists who may be especially mentioned here include Lillien Martin, the only woman sketched in this volume who was starred in *American Men of Science*. (She taught in the Indianapolis high schools before she was starred.) Kate Golden Bitting became a national authority on food preparation and preservation. Anne Lutz, a micro-technologist of distinction, was compared with Mme. Curie by *The New York Times*. Martha Doan served long as professor of chemistry and dean at Earlham. Winona Welch of DePauw has been the only woman to become president of the Indiana Academy of Science. Further information about these women is given in the sketches.

Monroe 5, Wayne 6, Tippecanoe 6, Union 6, Newton 7, Switzerland 7, Jasper 7, St. Joseph 7, Putnam 7, Montgomery 8, Marion 8, Grant 8, White 8, Clinton 8, Fayette 8, Hamilton 8, Parke 8, Wabash 8, Elkhart 9, Howard 9, Benton 9, Dearborn 9, Greene 9, Boone 9, Cass 9, Lake 9, Vigo 9, Henry 10, Madison 10, Lagrange 10, Posey 10, Washington 10, Noble 10, Whitley 10.

The counties that yielded one of these scientists per 800 or fewer of its 1890 population are mostly located in central Indiana. The southern third of the state has only Switzerland and Monroe counties, and the northern third only Newton, Jasper and St. Joseph. The counties which had a population of more than 1800 per scientist were in southern Indiana except two in northern Indiana (Starke and Marshall), and two on the border of the north (Adams and Wells). Most counties having 1500 to 1800 people per native scientist were also in southern Indiana. However northwestern Indiana has two, bordering Starke county. Three counties are in the southern margin of the central third of the state (Morgan,

Shelby, Franklin) and three others in its northwestern part (Fountain, Warren and Vermillion).

This map displays a distinctly different pattern than that of the starred scientists. This reflects three conditions. The average starred scientist was born about 1875, while the average date of birth of all the scientists sketched in this book born in Indiana is 1890. In those 15 years, there had been notable changes, especially a decline in the southeastern part of the state, which had been most productive of starred scientists. The later map (not published here) reflects also less selection. The starred scientists are distinctly rarer than the average scientist.

### A RECENT STUDY OF THE RATIO OF SCIENTIST ALUMNI TO OTHER ALUMNI

That a number of Indiana colleges and universities have been exceptionally successful recently in producing scientists is indicated by a study published while this book was in press. In *Science* for May 11, 1951, R. H. Knapp and H. B. Goodrich of Wesleyan University, (Conn.) report that of the male alumni of 1924-1934 the percentage who obtained doctorates in science and were sketched in *American Men of Science*, 1949 was especially large in four Indiana schools. Of the hundreds of American collegiate institutions, Earlham ranked fourth in this ratio, DePauw eighth, Wabash thirty-sixth, and Butler forty-seventh.

The fact that Indiana University and Purdue were not among the first fifty schools in this study reflects the fact that relatively many of the male graduates of these universities chose careers in non-scientific fields, including law, business, engineering, agriculture, medicine.

## CHAPTER V

### SPECIAL STUDIES OF INDIANA SCIENTISTS REPRINTED FROM PROCEEDINGS OF THE INDIANA ACADEMY OF SCIENCE

#### Living Indiana Scientists, A Statistical Study

H. E. ZABEL and STEPHEN S. VISHER, Chicago, Ill., and Indiana Univ.

The seventh, 1944, edition of "American Men of Science" contains sketches of 655 scientists living in Indiana, 1,288 scientists who were born in Indiana and 1,215 collegiate alumni of Indiana colleges and universities. Indiana universities conferred the doctorate upon 334 scientists and the Masters or Engineering degree upon 172 who have not received a doctorate. These several groups, subtracting duplicates, total 2,304 living Indiana scientists. An additional 349 scientists now living elsewhere were faculty members in Indiana.

Of the 655 scientists living in Indiana in 1943, slightly more than two-thirds are connected with universities and colleges; one-fifth are with industrial firms.

Purdue University with 198 sketched scientists has nearly one-third of the scientists in the state, and nearly one-half of those connected with educational institutions. Indiana University has 97, Notre Dame 39, DePauw 18, Butler 13, Rose Polytechnic 9, Valparaiso 9, Ball State 8, Earlham 7 and Wabash 7. Four colleges have 5 each: Goshen, Hanover, Manchester and Indiana State Teachers. Taylor and Franklin each have 4, Indiana Central and Evansville 3 and Marion 2. Seven colleges have one each (Huntington, Kokomo Jr., Oakland City, St. Francis, St. Joseph, St. Mary-of-the-Woods, and Tristate).

The industrial concerns with most sketched scientists are Eli Lilly 30, Standard Oil of Indiana 29, Commercial Solvents 16, Mead Johnson 9, Servel 7, Pittman-Moore 5, Reilly Tar and Chemical 3.

Indiana has a larger percentage of its sketched scientists employed by industrial concerns than is true for most states, because Indiana is more highly industrialized than are most states.

#### Birthplace of Scientists Born in Indiana

Indiana is given as their native state by 1,288 scientists sketched in the 1944 edition of "American Men of Science." Only six states yielded more, New York, Pennsylvania, Ohio, Illinois, Massachusetts, and Iowa. All but Iowa of these six states have notably larger populations than does Indiana. The states which rank eighth and ninth in the number of native scientists are Michigan and Wisconsin, both of which have about 200 fewer native scientists than Indiana.

Between the 1938 and 1944 editions of "American Men of Science," Indiana increased its contribution of scientists by 15 per cent, a greater increase than that of the total population. At about the average date of birth of the 1938 group, Indiana yielded 473 scientists per million population. For the 1944 group, the yield had increased to 494 per

million. Both of these yield figures are relatively high as compared with the larger sections of the country, except New England. The yield of the South was 173 per million, of the North Atlantic States 400, of the North Central States 448, of the Rocky Mountain and Pacific States 470. Indiana's relatively high yield reflects several conditions, including the presence of relatively few negroes or other colored people, very few of whom have been recognized as scientists.

The birthplace by counties of the 1,265 scientists who gave their birthplace adequately to permit county location is shown on Map 1. The 22 counties which yielded most are Marion with 86, Wayne 43, St. Joseph 37, Allen 35, Tippecanoe 34, Vigo 29, Montgomery 28, Clinton 26, Madison 25, Monroe 25, Howard 22, Cass 21, Grant 21, Hamilton 20, Delaware 19, Wabash 19, Elkhart 18, Randolph 18, Clay 17, Knox 17, Noble 17, Putnam 17.

Map 1. Number of scientists sketched in American Men of Science 1944, born in each county.

Map 2. Yield of living scientists per 100,000 population in 1900 by counties.

Map 1 shows that none of the counties which produced 16 or more living scientists are in the southern part of the state, except Monroe, Knox and Floyd. Conversely most of the counties which yielded fewer than 10 scientists are in southern Indiana, but 10 such counties are in the northwestern part of the state and three in northeastern. Only the smallest county in the state (Ohio) yielded no scientist, and only one other (Starke) yielded only one. Brown and Perry each yielded 2.

In proportion to population at about the average date of birth of these scientists, which was about 1900, the rank of the counties is appreciably different. The 20 highest, in decreasing order, are Monroe, Union, Wayne, Fayette, Montgomery, Switzerland, Clinton, Jasper, Newton, Tippecanoe, Hancock, Boone, Howard, Putnam, Washington, Hamilton, Noble, Johnson, Wabash and Owen.

When mapped (Map 2), it is apparent that the high ranking counties are situated neither near the northern or southern margins of the state, except that Switzerland County ranks high. Three counties that produced more than one scientist per 1,000 of population at about the time of their birth are in the east, Wayne (Richmond) and its southern neighbors. Three other high counties, which produced one scientist to little more than 1,000 people, are Tippecanoe (Lafayette) and two neighbors. Other high counties are Monroe (Bloomington) and Newton, Jasper and Hancock. Most of the counties which produced 69-89 scientists per 100,000 people are close to the most productive counties. Exceptions are Washington (with Salem and Paoli) and Noble, whose noble name may possibly have helped some of its native sons to high achievement.

Five of the ten counties which yielded fewest scientists in proportion to population border the Ohio river. Three others are also in southern Indiana. Northwestern Indiana has, however, two counties which rank low and three others which rank relatively low. The central third of the state, north and south, contains no county which ranks very low and only one (Rush) which ranks relatively low.

These data on the yield of scientists in proportion to population when they were born indicates that the presence of a college where science is valued played an appreciable role. The counties where colleges were conspicuous in 1900 all rank high. Thus, Wayne, Montgomery, Monroe, Tippecanoe counties with Earlham and Wabash colleges, Indiana and Purdue universities, all rank in the upper tenth of the counties in yield. Putnam, with DePauw, also ranks in the upper one-sixth of the counties. Three other high counties are close to Purdue University (Clinton, Jasper, Newton). Another high county (Hancock) although it has no college, is situated not far from several colleges. Switzerland and Noble counties are the most conspicuous exceptions to the rule that the high counties either have a college or are relatively close to one.

Although most of the college influence in increasing the yield of scientists in proportion to population is due to educational stimulation, mention may be made of the fact that quite a number of scientists born in college towns are the children of professors.

#### Collegiate Alumni of Indiana

The A.B. degree or its counterpart was received by 1,215 persons sketched in "American Men of Science," 1944. Only seven states have more such alumni than has Indiana, namely New York, Massachusetts, Ohio, Pennsylvania, Illinois, California and Michigan. These states all

have considerably larger college populations than does Indiana. It may be noted that Iowa, which was the birthplace of 4 more scientists than Indiana, falls behind Indiana in the number of scientific collegiate alumni. Conversely, Michigan and California, which were the birth-states of fewer scientists than was Indiana, have more alumni scientists.

The fact that Indiana was the birthplace of 1,288 scientists but conferred college training on 1,215 shows that 73 more embryo scientists went elsewhere for their college training than the number that came to Indiana colleges from other states. A comparable situation occurs in several other states, notably New York, Pennsylvania, Iowa, Missouri, New Jersey, Illinois and Kentucky. This shows that Indiana has failed somewhat to afford adequate educational facilities for future scientists, but Indiana has failed less badly than several other states have done. States that have afforded collegiate training to many more than their own native scientists are Massachusetts, California, Michigan, Connecticut and Washington.

The leading Indiana institutions in the collegiate training of these scientists are Indiana University with 331 such alumni, Purdue 253, DePauw 138, Wabash 95, Earlham 71, Valparaiso 64, Butler 54, Notre Dame 42, State Teachers 36, Manchester 22, Rose Polytech 22, Hanover 20, Franklin 14, Indiana Central 11, Goshen 9, Evansville (Moore's Hill) 9, Oakland City 8, Taylor 5, Marion 5, Tristate 4, St. Joseph 2, Huntington 2, Rochester 1.

FIG. 3 NUMBER OF COLLEGIATE ALUMNI SKETCHED IN AMERICAN MEN OF SCIENCE 1944

SHADED PART SHOWS THE INCREASE OF 1944 OVER 1938 EDITIONS

In proportion to the number of their alumni, several of the smaller schools, notably DePauw, Wabash, Earlham and Valparaiso, have started more scientists than have either Indiana University or Purdue. This is partly because many Purdue alumni became engineers or farmers, and many Indiana University alumni became lawyers, physicians or high school teachers, a few members of which groups win recognition as scientists.

The increase in the number of alumni sketched in the 1944 edition over the number sketched in the 1938 edition is of interest. Purdue's increase was 44, DePauw's was 35, Valparaiso's 27, Indiana University's 24, Butler's 15, Manchester's 11, Wabash's 10, Notre Dame's 8, State Teacher's 8, and Earlham's 3. (Fig. 3.)

As compared with universities and colleges in other states, five Indiana institutions rank among the nation's leading 100 in the number of college alumni sketched in "American Men of Science" 1944. Indiana University holds 20th place in the nation, Purdue 25th, DePauw 46th, Wabash 66th, Earlham 97th. This is despite the fact that five of the eight universities which rank highest in scientific alumni are situated close to Indiana and are relatively accessible to Indiana students. These five are the Universities of Michigan, Wisconsin, Illinois, Chicago and Ohio with the following numbers of collegiate alumni sketched in "American Men of Science" 1944: 849, 832, 786, 661, 640. Other relatively high ranking schools near Indiana, with the number of their living alumni recognized as scientists, are Michigan State 241, Oberlin 233, Northwestern 186, Cincinnati 133, Ohio Wesleyan 119, Miami 115, Western Reserve 81, Ohio U. 79, Denison 75, Wooster 75 and Case 75.

### Specialties of Indiana Scientists

Chemistry has attracted far more Indiana scientists than any other field. About one-fourth of the scientists born in Indiana became chemists, as did slightly more than a fourth of the collegiate alumni; nearly half of those who received doctorates in science in Indiana majored in chemistry. About 30 per cent of the scientists in Indiana in 1943 were chemists.

Physics ranks second to chemistry as a scientific choice, with somewhat more than a third as many devotees. Next comes botany, followed by mathematics, zoology and geology. The numbers in each of these and various other sciences are given in Table I.

Table I reveals that for several sciences, Indiana schools trained more future specialists than were born in Indiana. This was true for botany, plant pathology, pharmacy, anatomy and civil and mechanical engineering. Conversely Indiana has sent to other states for their college training more future specialists than have trained in Indiana in agronomy, geology, mathematics, entomology, plant physiology, forestry, pathology, medicine, astronomy and chemical engineering. Since considerable numbers of men have been trained in Indiana in these fields without later winning recognition as scientists, it appears that the training was less stimulating in these sciences than in some others.

Among the 334 doctorates received in Indiana by subsequently recognized scientists, there are, in addition to the 151 in chemistry already mentioned, 58 in physics, 19 in zoology, 15 in botany, 15 in geology, 14 in mathematics, 13 in psychology, 13 in pharmacy and 7 in physiology.

The percentages of the scientists sketched in "American Men of Science" 1944 who specialized in each of the more popular sciences has

been calculated for four other states as well as for Indiana. Some comparisons are of interest. Indiana with 27 per cent who are chemists exceeds Iowa, Minnesota, Massachusetts and Kansas, where from 24 to 19 per cent are chemists. In physics also Indiana, with 9.7 per cent leads.

TABLE 2 INDIANA SCIENTISTS CLASSIFIED BY EMPLOYMENT BY SCIENCES

Each of the other four states have about 6.4 per cent of their scientists in physics. Indiana also leads in botany (7.9), in which science Minnesota, Iowa and Kansas have about 6.5 per cent of their scientists botanists, and Massachusetts 5 per cent. In medicine, Indiana with 3.4 ranks close to Iowa and Kansas but far behind Massachusetts and Minnesota, each of which have 8 per cent of their scientists in medicine. Indiana also is behind in agriculture, zoology and geology. It is about average in engineering and slightly above average in mathematics and bacteriology.

### Institutional Connections of Indiana Scientists

Of the 2,653 Indiana scientists here considered, 1,669 or 63.3 per cent were employed in 1943 by colleges and universities, 600 or 22.5 per cent were employed by industry, 254 or nearly 10 per cent worked for the government, 71 were privately employed, 37 were employed by foundations and museums, and 22 were retired. Of the 717 employed chemists, industry took 364, educational institutions 280, the government 54. Of the 256 employed physicists, colleges and universities took 191, industry 40, government 18. Only 5 of the 165 mathematicians were employed by industry in 1943, in contrast to 154 as teachers. Indeed, aside from chemists, physicists, engineers (68), bacteriologists (21), pharmacologists (14) and geologists (16), industry employed few of these scientists. Nevertheless, of the younger scientists, ever increasing percentage are employed by industry. (Table II.)

The 600 Indiana scientists employed by industry are connected with a total of 293 distinct firms of which 221 employed only one each, 32 employed 2 each, 13 employed 3, 7 employed 4, 4 employed 5, 5 employed 6, 6 employed 7-10. Only six firms outside of Indiana employed more than 6 Indiana scientists. These are Dupont 40, Standard Oil Research Co. 14, Dow Chemical 10, American Cyanamide 10, Monsanto 8, Abbott Laboratories 7; companies employing 6 are U. S. Rubber, R.C.A., Bell, Eastman, Alcoa. Only about one-tenth of Indiana's scientists are employed by one of the 13 large corporations which are especially conspicuous for their research activity (recently characterized by Secretary Henry A. Wallace as "dominating industrial research"). Why are not more Indiana scientists employed by these 13?

### Age Distribution of Indiana Scientists

The median age of the Indiana scientists sketched in "American Men of Science" 1944 was 47 years in 1944. The oldest 29 were born before 1865, 316 or 12 per cent were 65 or older in 1944 and 7 per cent were 60-64. At the other extreme, 88 were born since 1914. Thus relatively few win the recognition of being sketched in "American Men of Science" before reaching 30. The Indiana botanists are older, on the average, than the chemists, mathematicians, physicists, bacteriologists, pharmacologists or geologists. Conspicuously young as groups are the organic chemists, physicists and geneticists.

### Conclusion

Indiana has reared and trained relatively many recognized scientists, and has done conspicuously well with respect to some of the basic sciences. Although Indiana has done better in employing scientists than have many other states, more than half of the scientists reared or trained in Indiana are unable to find suitable employment in this state. This is especially true of the higher types of scientists, those

starred by secret vote of their fellow scientists as especially distinguished. Of this distinguished group, Indiana employs less than one-fifth as many as were born here. (Sixty-one living in 1943 were born in Indiana, only eleven resident here, and of these eleven, five had retired.) Also regrettable is the fact that in several of the sciences, Indiana lags badly behind other progressive states. Such a factual presentation as here presented will assist, it is hoped, to correct these conditions.

## Starred Scientists Born or Trained in Indiana

By STEPHEN S. VISHER, Indiana University

Indiana was the state of birth of 81 starred scientists and the state in which 80 received their collegiate training. These Indiana scientists are about 3.6 percent of all the starred scientists who were born in the United States or received their college training here. They were starred in one or more of the seven editions of "American Men of Science" as especially distinguished in research. The voting was by secret ballot of the leaders in their science. Twenty-eight were starred in the first edition (1906), 11 to 13 in the second (1910), third (1921), and seventh (1944) editions, and 4, 5, or 8 in the other editions.

As part of an effort to learn more about what conditions are conducive to high achievement, the published data on the places of birth and of training of the starred scientists have been studied in considerable detail. In addition, a comprehensive questionnaire was sent in November, 1946, to those living, asking, among other questions, what influences they considered to have been most significant in their own case.

The present article is an abstract of some of the data on the scientists who were born in Indiana or who received their college degree there.

### Yield in Proportion to Population

Indiana is exceeded in yield of starred scientists per million of population at their average date of birth by the New England States, the other East North Central States, by half of the West North Central States, and by New York, New Jersey, Delaware, Maryland and Wyoming. Indiana exceeds the remaining states, most of them by a wide margin. For example, Indiana's total yield per million of population is more than 10 times that of Arkansas, Mississippi, or Oklahoma and more than 5 times that of Alabama, Georgia, Louisiana or New Mexico. It was more than 3 times that of North Carolina, West Virginia, Kentucky, Tennessee, Florida or North Dakota. It was more than twice that of South Carolina, Virginia, Colorado, Montana, Utah or Oregon.

In the yield of *botanists*, Indiana was surpassed only by 8 states (Connecticut, Massachusetts, Vermont, New York, Illinois, Michigan, Wisconsin, and Nebraska). In the yield of *zoologists*, Indiana was surpassed by only 10 states (New England, except R. I., New York, Kansas, Minnesota, Maryland). In the yield of *psychologists*, Indiana was surpassed only by 8 states (New England, Utah and Wyoming). For *astronomers*, Indiana was surpassed by 12 states (New England, Ohio, Illinois, Michigan, Minnesota, Colorado and California). As to *anatomists*, Indiana was surpassed by 14 states; as to *anthropologists*, by 4 states; as to *chemists*, by 15 states; as to *geologists*, by 17 states;

as to *mathematicians*, by 16 states; as to *pathologists*, by 12 states; as to *physicists*, by 25 states; and as to *physiologists*, by 12 states. Thus Indiana's rank among the states was lowest as to *physicists* and relatively low as to *geologists*, *chemists*, *mathematicians*.

Table 1 gives the number of these scientists born in Indiana by decade of birth and by science. It reveals that half of the total were born in the 20 years 1860-1879, 30 were born since 1880, none since 1904. The yield of starred scientists per million of population was about 11 for the 1870's, 10 for the 1860's, 6 for the 1880's and somewhat more than 3 per million for the 1890's and 1900's. The causes for these changes in productivity are significant, and merit discussion.

Table 1 also shows that nearly one-fourth, 19, were starred in zoology, while 12 were starred in botany, 11 in chemistry and 6 or 7 each in geology, physics or psychology. Each of the 12 sciences in which starring has been done is represented by 2 or more Hoosiers. The relatively large numbers starred in zoology reflects the influence of David Starr Jordan. Several of the botanists were students of John Merle Coulter.

### Areal Contrasts in Yield of Scientists

List 1 gives by science the names of the starred scientists born in Indiana, with the year and place of their birth, and list 7 presents the birth places by counties. When these birth places are mapped, it is seen that just half of the counties yielded no starred scientists, and a quarter of them yielded only one each. By contrast, Marion County yielded 5, Switzerland, Johnson and Wayne counties each 4, and Jefferson, Union, Hancock, Allen and Vigo 3 each. The yield by quarters of the State's population at the median date of the birth of these 81 scientists (1875) is as follows: the southeast quarter was the birthplace of 29 scientists, giving a yield of 14.5 per 100,000 of population. The northeast quarter yielded 23, or 11.5 per 100,000 population. The southwest yielded 19 or 9.5 per 100,000. The northwest yielded 11, or 5.5 per 100,000. Thus the southeast quarter did nearly three times as well as the equally populous northwest, and the northeast fully twice as well. The eastern half of the state's population yielded 63.5% of the total number, the southern half yielded 58.5%.

The unglaciated part of the State yielded 8 starred scientists, or at a rate of 4.8 per 100,000 of population. The relatively prosperous lower Wabash Valley Lowland of the southwestern part of the State, south of Terre Haute, yielded only one starred scientist. These 9 southwestern counties yielded starred scientists at the rate of one per 220,000 people. Fifteen northwestern counties having a combined population of 250,000 people yielded none. Two of these northwestern counties contain Wabash College and Purdue University. Why should 15 counties east and southeast of Marion County having a combined population of 284,000 people yield 30 starred scientists or one per 9,500 people while a similar number of counties in the northwest having as many people yielded none?

### Theories as to Regional Contrasts in Yield

Seven theories as to the yield of notables are:

1. That leaders come from especially prosperous areas. This certainly is not true for all of Indiana. Crawford and Switzerland counties, two of the poorest in the State, yielded at the rate of 1 scientist per 4,200 people, while Benton, Howard, Rush, Blackford, Knox and many other rich counties with a combined population of much more than 200,000 people yielded not one starred scientist.

2. Another theory is that notable leaders come largely from areas which are educationally favored. In Indiana, for example, the counties containing Earlham and Franklin colleges and DePauw and Indiana universities yielded 10 starred scientists, one-eighth of the total number, although at the average date of birth of the scientists these counties contained only 95,000 people, or somewhat less than one-twentieth of the state's population. But on the other hand, 5 of the 6 counties which had the highest yield of starred scientists in proportion to population lacked colleges. These especially productive counties were Union,

Switzerland, Jefferson, Hancock, and Parke, with a total yield of 13 starred scientists from a population of 82,000 people, or an average of one scientist for 6,300 people. (Union and Switzerland counties did twice as well as this average). These 5 counties yielded starred scientists at about 50 percent higher rate than did the best 4 counties with colleges.

3. A third theory to explain the regional contrasts in yield of outstanding leaders is that they come from the culturally more advanced areas, not from frontiers. The Indiana data lends some support to this theory, as the southeastern part of the State was the first to be well-peopled, while the northwest was settled latest. However the inadequacy of this explanation is indicated by the fact that several parts of the state settled early yielded no starred scientist; an example is the southwestern part, Vincennes and Washington south to the Ohio River. Crawfordsville was another early cultural center which has yielded no starred scientists, although several have graduated from Wabash College. And Tippecanoe County, containing Purdue, has yielded none.

4. A fourth theory is that the distribution is erratic, a matter of chance. This theory is disproved by many data. The more the subject is studied, the more evidence is disclosed that "it is not mere chance."

5. A fifth theory is that wherever economic and cultural conditions are at least fairly favorable, the areal differences in yield of notables correlates with contrasts in the quality of segments of the population. In Indiana, a considerable number of the starred scientists were descendents of persons who left Germany in 1848 or soon thereafter, partly because they sought greater freedom from the oppression then imposed. Several other Indiana-born scientists were the children of Quakers or of Scotch Presbyterians who had come to Indiana from the Carolinas before the Civil War partly because they disapproved of slavery. The Quaker group, which settled largely fairly near Richmond (where they established Earlham College) yielded several of the starred scientists of Union, Wayne, and Randolph counties, and also the two from Parke County and the one from Orange County. The Scotch Presbyterians were less concentrated; they yielded several of the 81. Several other Indiana starred scientists had Puritan ancestors. Puritan "stock" has been especially productive of starred scientists, according to the returns from Cattell's 1904 and the present author's 1946 questionnaire, and to much other evidence. Most of the starred scientists born in northern Indiana had Puritan ancestors as did several of those born in southern Indiana.

6. A sixth theory is that outstanding leaders such as the starred scientists come from families that are especially alert, earnest, and ambitious, without respect to their racial backgrounds, and that such people tend to congregate in places of comparative opportunity for them to use their talents. Bits of evidence from the data as to the Indiana starred scientists which supports this theory include: When southeastern Indiana was relatively favored, it produced many leaders, but when, because of the depletion of soil and forest wealth and especially when greater opportunities opened elsewhere, many of the more ambitious

people moved away. As a result, southeastern Indiana has yielded few starred scientists for many years. For example none were born since 1880 in four of the southeastern counties which were especially productive earlier (Crawford, Jefferson, Switzerland or Union counties). Likewise not one was born since 1880 in the entire unglaciated part of the State. Indeed, all 42 counties south of Wayne, Johnson and Vigo have yielded only two since 1881, one born in 1887 (Mann), and the other in 1901 (Twitty). Another evidence of the selective migration of the parents of the starred scientists is that relatively many starred scientists were born in county seats, the local centers of greatest opportunity for talent. The considerable number born in college towns is another evidence. The fact that of the 30 born in Indiana since 1880, 12 were born in the Gas Belt of the late 1880's and 1890's is significant. The boom experienced there attracted relatively many ambitious people. Both of Indiana's Nobel Prize winners, Urey and Stanley, were born in the northern half of the State since 1892.

7. A seventh theory to explain the contrasts in yield of notables is that, from young people with the requisite ability, leaders come if they receive adequate encouragement from those close to them and from stimulating teachers, provided opportunities are afforded to them to develop their talents. Conversely, few become such leaders if sufficiently stimulating teachers are not available, and if they are not encouraged to prepare themselves adequately, and if opportunities to serve as leaders are not available. This theory has much support in Indiana.

#### Starred Scientists who Obtained College Degrees in Indiana

Of the 81 native starred scientists, 49 obtained their college degrees in Indiana and 31 graduated elsewhere, (one, Mooney, did not graduate). However, those who went elsewhere for their college training were matched by 31 who came from other states or countries to Indiana for their college degrees.

Table 2 shows by science and decade of graduation the number of starred scientists who received college degrees in Indiana. It reveals that 19 zoologists graduated in Indiana, 16 botanists, 13 chemists, 11 physicists, 8 psychologists, 7 astronomers, 2 each of anthropology, mathematics and physiology, 1 each of geology and pathology and none in anatomy. The available data indicate that of the 19 zoologists, 5 were students of David Starr Jordan and 8 studied under students of his who later taught in Indiana. In addition, several of Dr. Jordan's students were later starred in other sciences than zoology and gave him much credit for his having stimulated them to high achievement. Of the 16 botanists, about 5 were students of John Merle Coulter and 4 or 5 were students of his former students who later taught in Indiana. Of the 13 chemists, 4 graduated at DePauw, 2 of them under W. M. Blanchard; 3 graduated at Earlham and one each at Butler, Hanover, Manchester, Notre Dame, Purdue and Valparaiso. Of the 11 physicists, 4 graduated at DePauw, 3 at Indiana, and 2 each at Purdue and Rose

Polytechnic, none elsewhere. Of the 8 psychologists, Indiana graduated 5, Earlham, Evansville and Valparaiso 1 each (Stone graduated from both Valparaiso and Indiana University). Of the 7 astronomers, Indiana graduated 5, of whom 4 were students of the other one, John A. Miller. The remaining 2 were from Rose Poly and Valparaiso. The 2 anthropologists graduated at Earlham and I. U. The 2 mathematicians graduated at I. U. and Purdue; also graduated at I. U. were the 2 physiologists, the geologist, and the pathologist. (The names of these alumni are given in lists 2-5).

Table 2 shows that the number of subsequently starred scientists who obtained their college degree in Indiana fluctuated among the half decades. During 1890-1894, 19 graduated, during the next half-decade 8, but during 1900-1904, 14. Conversely, only 1 graduated 1915-1919, although 7 graduated since 1919. Why not? What happened at Indiana University, for example, which caused it to graduate 5 in 1902 and 8 in 1903-1906 but only two since then? Of 266 men who graduated there in the 1880's, 5 were starred; of the 833 who graduated in the 1890's, 11 were starred; of the approximately 800 who graduated 1900-1906, 14 were starred. For 1907-1929 inclusive about 8000 men were graduated from I. U. Of these only 2 were starred. Thus nearly 2 percent of the graduates of the 1880's later were starred, 1.3 percent of the graduates of the 1890's, 1.6% of those of 1900-1906, less than 0.1% of those of the next decade and none at all since then!

The fluctuation in the proportion of the alumni who subsequently were starred correlates with several conditions, including changes in the faculty, changes in institutional policies, changes in size of enrollments and classes, changes in opportunities, changes in the age of the faculty. The large number of graduates of 1902-1906 who became distinguished scientists clearly merits special consideration. Apparently the coming of W. L. Bryan to the presidency in 1902 and the establishment of the Graduate School aroused hopes and greatly stimulated various students. Why the drastic decline after 1906? Apparently this was partly due to failure of the expectations aroused in 1902 to materialize. Significant also was the sharp increase in enrollments which occurred then, and the relatively great growth of the law school and medical school. Moreover since about 1907 many of the students taking zoology have done so because it is one of the requirements for admission to medical school, not because they were especially interested in zoology. Such students tend to divert students who had planned on becoming scientists. Other factors influencing the decline were the relatively notable advancement in certain other universities, and the greater opportunities in business. (Gary was founded in 1906 and industrialization developed rapidly in Indiana following 1906.) The progressive aging of the faculty also played a part. In 1902, most of the faculty were relatively young. Many of them continued in power, as heads of their departments, for some decades. When President Bryan retired in 1937, at the age of 77, many of the department heads and deans were elderly and, as is true of most elderly persons, no longer optimistic and enthusiastic.

List 2 gives by science and institution the names of the collegiate alumni, with the year of their graduation. (Stone received two bachelors degrees. Pike is listed under both zoology and physiology.)

As a sort of appendix are given 6 lists. List 3 gives by schools their starred alumni; List 4 and 5 give these by year of graduation, with some summary data. List 6 gives, alphabetically, the names of the 81 starred scientists born in Indiana. List 7 gives them by counties. List 8 gives those 31 born elsewhere who received college degrees in Indiana. At the end there is a summary and some conclusions.

### Summary and Conclusions

Indiana was the native state of 81 scientists starred in the biographical directory, "American Men of Science," (by secret vote of their fellow scientists) as especially distinguished in research. Each of the 12 sciences in which starring has been done have had 2 or more representatives born in Indiana; zoology had 19, botany 12, chemistry 11, physics 7, geology 6, psychology 6, astronomy 5, mathematics and pathology 4 each, physiology 3, and anatomy and anthropology 2 each. For 7 sciences, Indiana surpassed more than three-fourths of the 48 states in the yield of starred scientists per million of population at about the date of their birth. For 3 sciences (anatomy, chemistry and mathematics) it surpassed two-thirds of the states and it stood only a little lower for geology. Only for physics was it surpassed by slightly more than half of the states.

The birthplaces of these scientists are very unequally distributed over the state. In brief, of those born before 1880, the southeastern part of the state led by a wide margin, but of those born since 1880 the southern part of the state yielded few. Contrasts among the counties and sections of the state are presented in some detail, and several possible explanations of the contrasts are offered.

Indiana institutions conferred college degrees upon 81 subsequently starred scientists, 31 of whom were born elsewhere. By institutions Indiana University graduated 32, DePauw 12, Earlham 8, Wasbash 6, Purdue 5, Hanover and Valparaiso 4, Butler and Rose 3, and Evansville, Franklin, Manchester, and Notre Dame 1 each. Considerable evidence, summarized in the paper, indicates that personal encouragement by enthusiastic, stimulating teachers was an important influence in the output of subsequently starred scientists. For example, 13 of the 19 zoologists were students of David Starr Jordan or of men started by him. In addition, several of Dr. Jordan's students were starred in other sciences. Of the 16 botanists, about 10 were students of John Merle Coulter or of students of his. John A. Miller trained most of the astronomers. W. M. Blanchard trained 2 of the chemists. Conversely, despite very large enrollments in chemistry for many decades, only one Purdue alumnus has been starred in chemistry and none from Indiana University. This suggests that large classes, sort of mass production methods, are not conducive to stimulating young people to become scholars. What is needed in addition to able students is individual attention and personal encouragement.

## Men of Science in Indiana Past and Present

JOHN S. WRIGHT, Indianapolis

---

The history of Science in Indiana may be said to have begun about 150 years ago with the advent of General George Rogers Clark, who came to this territory first in 1778 and who was a resident of the present area of the state much of the time thereafter until his death in 1818.

Clark was a neighbor and a boyhood friend of Thomas Jefferson from whom he probably acquired his interest in science. Throughout his life as opportunity offered he was in communication with Jefferson and on one occasion sent him specimens of mammoth bones from the Ohio Valley.

Clark's powerful, active mind and training as a frontiersman and soldier made him an acute observer, constantly studying the Indians and the features of the country over which he fought. The Indian mounds engaged his attention. He discussed them with intelligent Indians and left among his records a paper on their origin, sharply at variance with the opinions then held by archeologists. Clark's conclusions have since proven to be substantially in accord with the deductions of those who later made studies of the excavations.

In his biography of Clark ("Clark of the Ohio"), Frederick Palmer says, Audubon, who came to Louisville in 1807, visited Clark, who on acquaintance said Audubon was a man after his own heart; that he was not like some of the "American Museum fellows," speculating on second-hand information (a reference to their theories of the origin of the mounds), but going out and seeing the life of the forests for himself. Audubon's notes of his visits with Clark were lost. Clark made none.

In 1803 before starting on the celebrated Lewis and Clark expedition, William Clark called on his famous brother, the General, at Clarks-ville, Indiana, from whom it is believed that he received priceless advice on the conduct of the expedition. General Clark was keenly interested in the Indians and in the scientific results of the exploration, and must have been delighted with the account William brought him when he made his last visit on the return of the expedition in 1806.

Although Clark published nothing on scientific subjects there was at least one paper on archeology in his records, referred to above. General Clark manifested repeatedly the proper spirit of the investigator, appreciation of scientific work and of true scientists. It is probably quite within bounds to claim him as the first man of science or of known scientific interests in Indiana.

The New Harmony period of science in Indiana runs from about 1825 to approximately 1860. During this time some of the most distinguished of American and a few celebrated European scientists visited New Harmony. Certain eminent scientists were resident in the community and did important work there. For example, David Dale

Owen made New Harmony his home and the seat from which he directed government geological surveys of sections of Iowa, Illinois, Minnesota, Nebraska, and Wisconsin during much of the period between 1837 and 1852. Considerable has been written of the New Harmony group so that it should not be difficult to assemble the facts essential to the history of this period of science in the state.

Probably the details of the story of science in the state for the first ten or twenty years following the beginning of the Civil War will require considerable searching of the records in the archives of the various colleges and universities of Indiana.

Once it becomes known that a responsible group in the Academy is endeavoring to prepare a history of science in the state it may be found that individuals interested in special fields of science have collected data on men and work in their respective fields and that they will be willing to contribute from their collections.

In 1885 Indiana was the home of a group of brilliant and purposeful scientists, some of whom were leaders of national standing in their respective fields; among them were Jordan, the Coulters, Mendenhall, Noyes, Campbell, Butler, and Branner. When these men organized the Academy their sponsorship gave it immediate standing and the Indiana Academy of Science has been one of the most successful of all similar state institutions. Until a high degree of specialization was reached, resulting in the organization of state branches of certain groups, for example the Indiana branch of the American Chemical Society, the Academy of Science membership included nearly all residents of the state engaged in scientific work. Its publications are a fairly complete index to the scientific interests and accomplishments in Indiana for a period of approximately 25 years.

Records of the special scientific societies supplementing the Academy's own proceedings will contain the majority of the material needed to write the story of the various fields of research in the state since 1885.

A comprehensive account of science in Indiana will include some of the activities of the state Audubon society, the engineering societies, research departments of technical industries, the public health service, the state departments having to do with conservation and the medical group.

In contemplating the undertaking, which happily has begun under a committee headed by Dr. Edington, it appears that the final committee should include a representative of each department of science, and one who has been in the state long enough to know something of the traditions of our higher educational institutions and of the Academy of Science.

The committeeman on geology, for example, could enlist the aid of someone in each college to search the records and report on all men connected with that institution, both past and present, who as geologists deserve a place in the record. Committeemen representing astronomy, botany, chemistry, engineering, mathematics, medicine, physics, zoology, etc., etc., could do the same with respect to their departments.

### *The Biographical Section*

The most useful and prized section of a volume on *Men of Science in Indiana Past and Present* will be the biographical dictionary or Who's Who. The story of science in the state as suggested above although quite important, would be to an extent prefatory, as the interest probably will center on the biographies.

The relationship of the man to the State in respect to his scientific career should be so clear that the authors and the sponsors of the biographies will not be open to the charge of claiming too much for Indiana science. An examination of a few biographies makes it apparent that there are seven or more degrees of connection between Indiana and men of science. These range from that of the native sons educated and residing in the state throughout their careers to that of men born and educated elsewhere but resident in the state for a short time only; men whose major work was done elsewhere. The following are examples of degrees of relationship:

#### **Men of Science in Indiana Past and Present**

1. *Native*—Education and career in the state.  
*Examples*—Amos W. Butler, Charles C. Deam, A. L. Foley.
  2. *Native*—Educated in Indiana, career chiefly elsewhere.  
*Examples*—Harvey W. Wiley, Henry L. Bolley, the Cory brothers, H. T. and C. L., W. C. Allee.
  3. *Native*—Higher education and career elsewhere.  
*Examples*—John S. Billings, M.D., George Brown Goode, George A. Reisner, Clarence A. Mills, M.D.
- 
4. *Not Native*—Educated and worked in Indiana.  
*Examples*—John M. and Stanley Coulter, Julius A. Nieuwland, Willis S. Blatchley.
  5. *Not Native*—Educated in Indiana but worked elsewhere.  
*Examples*—None occur to me now but doubtless the the alumni rolls of many Indiana colleges contain the names of such.
  6. *Not Native*—Educated elsewhere but worked in Indiana.  
*Examples*—Gen. George Rogers Clark, David S. Jordan, T. C. Mendenhall, Thomas Gray, J. C. Arthur, and hosts of others.
  7. *Not Native*—Educated and worked in science elsewhere but had brief residence in the State, or made visits in pursuit of scientific work.  
*Examples*—Constantine S. Raffinesque, John J. Audubon, others temporarily associated with the New Harmony group, Heinrich Schliemann, whose residence in Indianapolis for one year to obtain a divorce was of doubtful credit to the State.

With a list of names for consideration, questionnaires could be prepared and submitted for the information needed to prepare terse biographies. The American Men of Science style of biography is tentatively suggested as a model, to which might be added a brief bibliography of the more important papers and a statement of outstanding work of the individual, especially that done in Indiana.

Living subjects could be asked to submit their own biographies on a form provided. Obviously all such autobiographies would have to be subjected to careful editing to attain uniformity of style.

If each biography contained a terse statement of the ancestral stock of the subject, indicated the occupation of father, necessity and extent of self-support in college, valuable data would be afforded for statistical studies. It might not be expedient to publish all such data, nevertheless it would be worth collecting.

The Bulletin of the A.A.A.S. for July, 1944, carried an editorial by Secretary F. R. Moulton on the "Early Environment of Eminent Scientists." In this he said that there is a general impression that eminent scientists have had unfavorable educational environments in their early youth. This impression is neither affirmed nor denied but used by Dr. Moulton to point out the interest and importance of an investigation of the facts because of the light they would throw upon the problem of education and the factors which contribute to success in science.

The editorial states that men who have achieved high success in nearly every field have come from the farms and villages and quotes a recent advertisement as stating that every one of the presidents of the 18 operating companies of the Bell Telephone System began work as a clerk or in some other lowly position at a salary ranging from \$25 to \$65 a month. These successes, Dr. Moulton concludes, were not due to educational opportunities or to the lack of them and he asks "What factors internal and external are conducive to exceptional achievement?"

In the preparation of a volume on Men of Science in Indiana, it is recommended that in the assembling of biographical sketches an effort be made to include data that would throw light on early environmental and other factors that dispose men and women to scientific pursuits. With this in view the committee should include a member trained in statistical methods who could make some valuable deductions from the data.

About ten years ago I had the Fourth Edition of American Men of Science (1927) carefully examined and all biographies of men with Indiana connections marked. There were 13,500 entries in the volume; 692 were of men born or then living in Indiana, or 5.1 per cent of the whole, whereas the population of the state was then but 2.6 per cent of the national total.

Scientists living in the state in 1927 .....	215 or 1.6 per cent
Scientists born in the state .....	540 or 4.0 per cent
Scientists both born and living in the state in 1927 .....	63 or 0.46 per cent approx.
Scientists of Indiana connection starred as among the 1,000 distinguished .....	49 or 4.9 per cent

On the whole, men of science with Indiana connections made a creditable showing in 1927. Probably they would appear quite as well now.

In all probability Dr. Edington and his committee have considered many if not all of the details of procedure mentioned in this paper, nevertheless I felt an urge to present them as a result of contemplating the subject for several years, also to emphasize the richness of opportunity which confronts those who assume the work. It is predicted that the subject will grow in attractiveness and significance as more of the Academy members become engaged in helping the editorial committee.

The cost of collecting and editing the data will eventually amount to considerable. A small fund is now available for the preliminary work. From year to year the Academy should set aside from current net income such amounts as may be judged expedient to continue the work and to supplement other funds that may be contributed.

A carefully prepared brief history of the development of science in Indiana with a biographical dictionary of our men of science, past and present, would be a credit to the Academy, reflect honor on the State, and possibly incite similar work in other states. May the committee be confirmed, strengthened and supported in the enterprise.
